The following table shows the correspondence between `replication_connection_configuration` columns and `SHOW SLAVE STATUS` columns.

<code>replication_connection_configuration</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>HOST</code>	<code>Master_Host</code>
<code>PORT</code>	<code>Master_Port</code>
<code>USER</code>	<code>Master_User</code>
<code>NETWORK_INTERFACE</code>	<code>Master_Bind</code>
<code>AUTO_POSITION</code>	<code>Auto_Position</code>
<code>SSL_ALLOWED</code>	<code>Master_SSL_Allowed</code>
<code>SSL_CA_FILE</code>	<code>Master_SSL_CA_File</code>
<code>SSL_CA_PATH</code>	<code>Master_SSL_CA_Path</code>
<code>SSL_CERTIFICATE</code>	<code>Master_SSL_Cert</code>
<code>SSL_CIPHER</code>	<code>Master_SSL_Cipher</code>
<code>SSL_KEY</code>	<code>Master_SSL_Key</code>
<code>SSL_VERIFY_SERVER_CERTIFICATE</code>	<code>Master_SSL_Verify_Server_Cert</code>
<code>SSL_CRL_FILE</code>	<code>Master_SSL_Crl</code>
<code>SSL_CRL_PATH</code>	<code>Master_SSL_Crlpath</code>
<code>CONNECTION_RETRY_INTERVAL</code>	<code>Connect_Retry</code>
<code>CONNECTION_RETRY_COUNT</code>	<code>Master_Retry_Count</code>

### 25.11.11.2 The `replication_connection_status` Table

This table shows the current status of the I/O thread that handles the slave server connection to the master server.

Compared to the `replication_connection_configuration` table, `replication_connection_status` changes more frequently. It contains values that change during the connection, whereas `replication_connection_configuration` contains values which define how the slave connects to the master and that remain constant during the connection.

The `replication_connection_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 16.2.3, “Replication Channels”](#) for more information.

- `GROUP_NAME`

If this server is a member of a group, shows the name of the group the server belongs to.

- `SOURCE_UUID`

The `server_uuid` value from the master.

- `THREAD_ID`

The I/O thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle), `OFF` (thread no longer exists), or `CONNECTING` (thread exists and is connecting to the master).

- `RECEIVED_TRANSACTION_SET`

The set of global transaction IDs (GTIDs) corresponding to all transactions received by this slave. Empty if GTIDs are not in use. See [GTID Sets](#) for more information.

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the I/O thread to stop. An error number of 0 and message of the empty string mean “no error.” If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

- `LAST_ERROR_TIMESTAMP`

A timestamp in `YYMMDD HH:MM:SS` format that shows when the most recent I/O error took place.

- `LAST_HEARTBEAT_TIMESTAMP`

A timestamp in `YYMMDD HH:MM:SS` format that shows when the most recent heartbeat signal was received by a replication slave.

- `COUNT_RECEIVED_HEARTBEATS`

The total number of heartbeat signals that a replication slave received since the last time it was restarted or reset, or a `CHANGE MASTER TO` statement was issued.

`TRUNCATE TABLE` is not permitted for the `replication_connection_status` table.

The following table shows the correspondence between `replication_connection_status` columns and `SHOW SLAVE STATUS` columns.

<code>replication_connection_status</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>SOURCE_UUID</code>	<code>Master_UUID</code>
<code>THREAD_ID</code>	<code>None</code>
<code>SERVICE_STATE</code>	<code>Slave_IO_Running</code>
<code>RECEIVED_TRANSACTION_SET</code>	<code>Retrieved_Gtid_Set</code>
<code>LAST_ERROR_NUMBER</code>	<code>Last_IO_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_IO_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_IO_Error_Timestamp</code>

### 25.11.11.3 The `replication_applier_configuration` Table

This table shows the configuration parameters that affect transactions applied by the slave server. Parameters stored in the table can be changed at runtime with the `CHANGE MASTER TO` statement, as indicated in the column descriptions.

The `replication_applier_configuration` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 16.2.3, “Replication Channels”](#) for more information.

- `DESIRED_DELAY`

The number of seconds that the slave must lag the master. (`CHANGE MASTER TO` option: `MASTER_DELAY`)

`TRUNCATE TABLE` is not permitted for the `replication_applier_configuration` table.

The following table shows the correspondence between `replication_applier_configuration` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_configuration</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>DESIRED_DELAY</code>	<code>SQL_Delay</code>

#### 25.11.11.4 The `replication_applier_status` Table

This table shows the current general transaction execution status on the slave server. The table provides information about general aspects of transaction applier status that are not specific to any thread involved. Thread-specific status information is available in the `replication_applier_status_by_coordinator` table (and `replication_applier_status_by_worker` if the slave is multithreaded).

The `replication_applier_status` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 16.2.3, “Replication Channels”](#) for more information.

- `SERVICE_STATE`

Shows `ON` when the replication channel's applier threads are active or idle, `OFF` means that the applier threads are not active.

- `REMAINING_DELAY`

If the slave is waiting for `DESIRED_DELAY` seconds to pass since the master applied an event, this field contains the number of delay seconds remaining. At other times, this field is `NULL`. (The `DESIRED_DELAY` value is stored in the `replication_applier_configuration` table.)

- `COUNT_TRANSACTIONS_RETRIES`

Shows the number of retries that were made because the slave SQL thread failed to apply a transaction. The maximum number of retries for a given transaction is set by the `slave_transaction_retries` system variable.

`TRUNCATE TABLE` is not permitted for the `replication_applier_status` table.

The following table shows the correspondence between `replication_applier_status` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>SERVICE_STATE</code>	None
<code>REMAINING_DELAY</code>	<code>SQL_Remaining_Delay</code>

### 25.11.11.5 The `replication_applier_status_by_coordinator` Table

For a multithreaded slave, the slave uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the coordinator thread. For a single-threaded slave, this table is empty. For a multithreaded slave, the `replication_applier_status_by_worker` table shows the status of the worker threads.

The `replication_applier_status_by_coordinator` table has these columns:

- `CHANNEL_NAME`

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 16.2.3, “Replication Channels”](#) for more information.

- `THREAD_ID`

The SQL/coordinator thread ID.

- `SERVICE_STATE`

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- `LAST_ERROR_NUMBER`, `LAST_ERROR_MESSAGE`

The error number and error message of the most recent error that caused the SQL/coordinator thread to stop. An error number of 0 and message which is an empty string means “no error”. If the `LAST_ERROR_MESSAGE` value is not empty, the error values also appear in the slave's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

All error codes and messages displayed in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns correspond to error values listed in [Section B.3, “Server Error Codes and Messages”](#).

- `LAST_ERROR_TIMESTAMP`

A timestamp in `YYMMDD HH:MM:SS` format that shows when the most recent SQL/coordinator error occurred.

`TRUNCATE TABLE` is not permitted for the `replication_applier_status_by_coordinator` table.

The following table shows the correspondence between `replication_applier_status_by_coordinator` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status_by_coordinator</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	<code>Slave_SQL_Running</code>
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 25.11.11.6 The `replication_applier_status_by_worker` Table

If the slave is not multithreaded, this table shows the status of the applier thread. Otherwise, the slave uses multiple worker threads and a coordinator thread to manage them, and this table shows the status of the worker threads. For a multithreaded slave, the [replication\\_applier\\_status\\_by\\_coordinator](#) table shows the status of the coordinator thread.

The [replication\\_applier\\_status\\_by\\_worker](#) table has these columns:

- [CHANNEL\\_NAME](#)

The replication channel which this row is displaying. There is always a default replication channel, and more replication channels can be added. See [Section 16.2.3, “Replication Channels”](#) for more information.

- [WORKER\\_ID](#)

The worker identifier (same value as the `id` column in the `mysql.slave_worker_info` table). After `STOP SLAVE`, the `THREAD_ID` column becomes `NULL`, but the `WORKER_ID` value is preserved.

- [THREAD\\_ID](#)

The worker thread identifier.

- [SERVICE\\_STATE](#)

`ON` (thread exists and is active or idle) or `OFF` (thread no longer exists).

- [LAST\\_SEEN\\_TRANSACTION](#)

The transaction that the worker has last seen. The worker has not necessarily applied this transaction because it could still be in the process of doing so.

If the `gtid_mode` system variable value is `OFF`, this column is `ANONYMOUS`, indicating that transactions do not have global transaction identifiers (GTIDs) and are identified by file and position only.

If `gtid_mode` is `ON`, the column value is defined as follows:

- If no transaction has executed, the column is empty.
- When a transaction has executed, the column is set from `gtid_next` as soon as `gtid_next` is set. From this moment, the column always shows a GTID.
- The GTID is preserved until the next transaction is executed. If an error occurs, the column value is the GTID of the transaction being executed by the worker when the error occurred. The following statement shows whether or not that transaction has been committed:

```
SELECT GTID_SUBSET(LAST_SEEN_TRANSACTION, @@GLOBAL.GTID_EXECUTED)
FROM performance_schema.replication_applier_status_by_worker;
```

If the statement returns zero, the transaction has not yet been committed, either because it is still being processed, or because the worker thread was stopped while it was being processed. If the statement returns nonzero, the transaction has been committed.

- [LAST\\_ERROR\\_NUMBER](#), [LAST\\_ERROR\\_MESSAGE](#)

The error number and error message of the most recent error that caused the worker thread to stop. An error number of 0 and message of the empty string mean “no error”. If the [LAST\\_ERROR\\_MESSAGE](#) value is not empty, the error values also appear in the slave's error log.

Issuing `RESET MASTER` or `RESET SLAVE` resets the values shown in these columns.

All error codes and messages displayed in the `LAST_ERROR_NUMBER` and `LAST_ERROR_MESSAGE` columns correspond to error values listed in [Section B.3, “Server Error Codes and Messages”](#).

- `LAST_ERROR_TIMESTAMP`

A timestamp in `YYMMDD HH:MM:SS` format that shows when the most recent worker error occurred.

`TRUNCATE TABLE` is not permitted for the `replication_applier_status_by_worker` table.

The following table shows the correspondence between `replication_applier_status_by_worker` columns and `SHOW SLAVE STATUS` columns.

<code>replication_applier_status_by_worker</code> Column	<code>SHOW SLAVE STATUS</code> Column
<code>WORKER_ID</code>	None
<code>THREAD_ID</code>	None
<code>SERVICE_STATE</code>	None
<code>LAST_SEEN_TRANSACTION</code>	None
<code>LAST_ERROR_NUMBER</code>	<code>Last_SQL_Errno</code>
<code>LAST_ERROR_MESSAGE</code>	<code>Last_SQL_Error</code>
<code>LAST_ERROR_TIMESTAMP</code>	<code>Last_SQL_Error_Timestamp</code>

### 25.11.11.7 The `replication_group_members` Table

This table shows network and status information for replication group members. The network addresses shown are the addresses used to connect clients to the group, and should not be confused with the member's internal group communication address specified by `group_replication_local_address`.

The `replication_group_members` table has the following columns:

- `CHANNEL_NAME`

Name of the Group Replication channel.

- `MEMBER_ID`

Identifier for this member; the same as the server UUID.

- `MEMBER_HOST`

Network address of this member (host name or IP address). Retrieved from the member's `hostname` variable.

- `MEMBER_PORT`

Port on which the server is listening. Retrieved from the member's `port` variable.

- `MEMBER_STATE`

Current state of this member; can be any one of the following:

- `OFFLINE`: The Group Replication plugin is installed but has not been started.
- `RECOVERING`: The server has joined a group from which it is retrieving data.
- `ONLINE`: The member is in a fully functioning state.

`TRUNCATE TABLE` is not permitted for the `replication_group_members` table.

### 25.11.11.8 The `replication_group_member_stats` Table

This table shows statistical information for MySQL Group Replication members. It is populated only when Group Replication is running.

The `replication_group_member_stats` table has the following columns:

- `CHANNEL_NAME`  
Name of the Group Replication channel.
- `VIEW_ID`  
Current view identifier for this group.
- `MEMBER_ID`  
Identifier for this member; same as the server UUID.
- `COUNT_TRANSACTIONS_IN_QUEUE`  
Number of transactions pending certification.
- `COUNT_TRANSACTIONS_CHECKED`  
Number of transactions already certified by this member.
- `COUNT_CONFLICTS_DETECTED`  
Number of transactions that were negatively certified.
- `COUNT_TRANSACTIONS_ROWS_VALIDATING`  
Number of transaction rows available which could be used for certification, but which have not been garbage collected.
- `TRANSACTIONS_COMMITTED_ALL_MEMBERS`  
Set of stable group transactions.
- `LAST_CONFLICT_FREE_TRANSACTION`  
Latest transaction certified without conflicts.

`TRUNCATE TABLE` is not permitted for the `replication_group_member_stats` table.

## 25.11.12 Performance Schema Lock Tables

The Performance Schema exposes lock information through these tables:

- `metadata_locks`: Metadata locks held and requested
- `table_handles`: Table locks held and requested

The following sections describe these tables in more detail.

### 25.11.12.1 The `metadata_locks` Table

MySQL uses metadata locking to manage concurrent access to database objects and to ensure data consistency; see [Section 8.11.4, “Metadata Locking”](#).

The Performance Schema exposes metadata lock information through the `metadata_locks` table:

- Locks that have been granted (shows which sessions own which current metadata locks).
- Locks that have been requested but not yet granted (shows which sessions are waiting for which metadata locks).
- Lock requests that have been killed by the deadlock detector.
- Lock requests that have timed out and are waiting for the requesting session's lock request to be discarded.

This information enables you to understand metadata lock dependencies between sessions. You can see not only which lock a session is waiting for, but which session currently holds that lock.

The `metadata_locks` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_metadata_locks` system variable at server startup.

Metadata lock instrumentation uses the `wait/lock/metadata/sql/mdl` instrument, which is disabled by default.

To control metadata lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/metadata/sql/mdl=OFF'
```

To control metadata lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

The Performance Schema maintains `metadata_locks` table content as follows, using the `LOCK_STATUS` column to indicate the status of each lock:

- When a metadata lock is requested and obtained immediately, a row with a status of `GRANTED` is inserted.
- When a metadata lock is requested and not obtained immediately, a row with a status of `PENDING` is inserted.
- When a metadata lock previously requested is granted, its row status is updated to `GRANTED`.
- When a metadata lock is released, its row is deleted.
- When a pending lock request is canceled by the deadlock detector to break a deadlock (`ER_LOCK_DEADLOCK`), its row status is updated from `PENDING` to `VICTIM`.

- When a pending lock request times out ([ER\\_LOCK\\_WAIT\\_TIMEOUT](#)), its row status is updated from [PENDING](#) to [TIMEOUT](#).
- When granted lock or pending lock request is killed, its row status is updated from [GRANTED](#) or [PENDING](#) to [KILLED](#).
- The [VICTIM](#), [TIMEOUT](#), and [KILLED](#) status values are brief and signify that the lock row is about to be deleted.
- The [PRE\\_ACQUIRE\\_NOTIFY](#) and [POST\\_RELEASE\\_NOTIFY](#) status values are brief and signify that the metadata locking subsystem is notifying interested storage engines while entering lock acquisition operations or leaving lock release operations. These status values were added in MySQL 5.7.11.

The [metadata\\_locks](#) table has these columns:

- [OBJECT\\_TYPE](#)

The type of lock used in the metadata lock subsystem. The value is one of [GLOBAL](#), [SCHEMA](#), [TABLE](#), [FUNCTION](#), [PROCEDURE](#), [TRIGGER](#) (currently unused), [EVENT](#), [COMMIT](#), [USER\\_LEVEL\\_LOCK](#), [TABLESPACE](#), or [LOCKING\\_SERVICE](#).

A value of [USER\\_LEVEL\\_LOCK](#) indicates a lock acquired with [GET\\_LOCK\(\)](#). A value of [LOCKING\\_SERVICE](#) indicates a lock acquired using the locking service described in [Section 28.3.1](#), “The Locking Service”.

- [OBJECT\\_SCHEMA](#)

The schema that contains the object.

- [OBJECT\\_NAME](#)

The name of the instrumented object.

- [OBJECT\\_INSTANCE\\_BEGIN](#)

The address in memory of the instrumented object.

- [LOCK\\_TYPE](#)

The lock type from the metadata lock subsystem. The value is one of [INTENTION\\_EXCLUSIVE](#), [SHARED](#), [SHARED\\_HIGH\\_PRIO](#), [SHARED\\_READ](#), [SHARED\\_WRITE](#), [SHARED\\_UPGRADABLE](#), [SHARED\\_NO\\_WRITE](#), [SHARED\\_NO\\_READ\\_WRITE](#), or [EXCLUSIVE](#).

- [LOCK\\_DURATION](#)

The lock duration from the metadata lock subsystem. The value is one of [STATEMENT](#), [TRANSACTION](#), or [EXPLICIT](#). The [STATEMENT](#) and [TRANSACTION](#) values signify locks that are released implicitly at statement or transaction end, respectively. The [EXPLICIT](#) value signifies locks that survive statement or transaction end and are released by explicit action, such as global locks acquired with [FLUSH TABLES WITH READ LOCK](#).

- [LOCK\\_STATUS](#)

The lock status from the metadata lock subsystem. The value is one of [PENDING](#), [GRANTED](#), [VICTIM](#), [TIMEOUT](#), [KILLED](#), [PRE\\_ACQUIRE\\_NOTIFY](#), or [POST\\_RELEASE\\_NOTIFY](#). The Performance Schema assigns these values as described previously.

- [SOURCE](#)

The name of the source file containing the instrumented code that produced the event and the line number in the file at which the instrumentation occurs. This enables you to check the source to determine exactly what code is involved.

- [OWNER\\_THREAD\\_ID](#)

The thread requesting a metadata lock.

- [OWNER\\_EVENT\\_ID](#)

The event requesting a metadata lock.

`TRUNCATE TABLE` is not permitted for the `metadata_locks` table.

### 25.11.12.2 The `table_handles` Table

The Performance Schema exposes table lock information through the `table_handles` table to show the table locks currently in effect for each opened table handle. `table_handles` reports what is recorded by the table lock instrumentation. This information shows which table handles the server has open, how they are locked, and by which sessions.

The `table_handles` table is read only and cannot be updated. It is autosized by default; to configure the table size, set the `performance_schema_max_table_handles` system variable at server startup.

Table lock instrumentation uses the `wait/lock/table/sql/handler` instrument, which is enabled by default.

To control table lock instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='wait/lock/table/sql/handler=OFF'
```

To control table lock instrumentation state at runtime, update the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES', TIMED = 'YES'
WHERE NAME = 'wait/lock/table/sql/handler';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO', TIMED = 'NO'
WHERE NAME = 'wait/lock/table/sql/handler';
```

The `table_handles` table has these columns:

- [OBJECT\\_TYPE](#)

The table opened by a table handle.

- [OBJECT\\_SCHEMA](#)

The schema that contains the object.

- [OBJECT\\_NAME](#)

The name of the instrumented object.

- `OBJECT_INSTANCE_BEGIN`

The table handle address in memory.

- `OWNER_THREAD_ID`

The thread owning the table handle.

- `OWNER_EVENT_ID`

The event which caused the table handle to be opened.

- `INTERNAL_LOCK`

The table lock used at the SQL level. The value is one of `READ`, `READ WITH SHARED LOCKS`, `READ HIGH PRIORITY`, `READ NO INSERT`, `WRITE ALLOW WRITE`, `WRITE CONCURRENT INSERT`, `WRITE LOW PRIORITY`, or `WRITE`. For information about these lock types, see the `include/thr_lock.h` source file.

- `EXTERNAL_LOCK`

The table lock used at the storage engine level. The value is one of `READ EXTERNAL` or `WRITE EXTERNAL`.

`TRUNCATE TABLE` is not permitted for the `table_handles` table.

## 25.11.13 Performance Schema System Variable Tables

### Note

The value of the `show_compatibility_56` system variable affects the information available from the tables described here. For details, see the description of that variable in [Section 5.1.7, “Server System Variables”](#).

The MySQL server maintains many system variables that indicate how it is configured (see [Section 5.1.7, “Server System Variables”](#)). System variable information is available in these Performance Schema tables:

- `global_variables`: Global system variables. An application that wants only global values should use this table.
- `session_variables`: System variables for the current session. An application that wants all system variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `variables_by_thread`: Session system variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

The session variable tables (`session_variables`, `variables_by_thread`) contain information only for active sessions, not terminated sessions.

`TRUNCATE TABLE` is not supported for Performance Schema system variable tables.

The `global_variables` and `session_variables` tables have these columns:

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The system variable value. For `global_variables`, this column contains the global value. For `session_variables`, this column contains the variable value in effect for the current session.

The `variables_by_thread` table has these columns:

- `THREAD_ID`

The thread identifier of the session in which the system variable is defined.

- `VARIABLE_NAME`

The system variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `variables_by_thread` table contains system variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the `Performance_schema_thread_instances_lost` status variable will be greater than zero.

## 25.11.14 Performance Schema Status Variable Tables

### Note

The value of the `show_compatibility_56` system variable affects the information available from the tables described here. For details, see the description of that variable in [Section 5.1.7, “Server System Variables”](#).

The MySQL server maintains many status variables that provide information about its operation (see [Section 5.1.9, “Server Status Variables”](#)). Status variable information is available in these Performance Schema tables:

- `global_status`: Global status variables. An application that wants only global values should use this table.
- `session_status`: Status variables for the current session. An application that wants all status variable values for its own session should use this table. It includes the session variables for its session, as well as the values of global variables that have no session counterpart.
- `status_by_thread`: Session status variables for each active session. An application that wants to know the session variable values for specific sessions should use this table. It includes session variables only, identified by thread ID.

There are also summary tables that provide status variable information aggregated by account, host name, and user name. See [Section 25.11.15.10, “Status Variable Summary Tables”](#).

The session variable tables (`session_status`, `status_by_thread`) contain information only for active sessions, not terminated sessions.

The Performance Schema collects statistics for global status variables only for threads for which the `INSTRUMENTED` value is `YES` in the `threads` table. Statistics for session status variables are always collected, regardless of the `INSTRUMENTED` value.

The Performance Schema does not collect statistics for `Com_xxx` status variables in the status variable tables. To obtain global and per-session statement execution counts, use the `events_statements_summary_global_by_event_name` and `events_statements_summary_by_thread_by_event_name` tables, respectively. For example:

```
SELECT EVENT_NAME, COUNT_STAR
FROM performance_schema.events_statements_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'statement/sql/%';
```

The `global_status` and `session_status` tables have these columns:

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The status variable value. For `global_status`, this column contains the global value. For `session_status`, this column contains the variable value for the current session.

The `status_by_thread` table contains the status of each active thread. It has these columns:

- `THREAD_ID`

The thread identifier of the session in which the status variable is defined.

- `VARIABLE_NAME`

The status variable name.

- `VARIABLE_VALUE`

The session variable value for the session named by the `THREAD_ID` column.

The `status_by_thread` table contains status variable information only about foreground threads. If the `performance_schema_max_thread_instances` system variable is not autoscaled (signified by a value of -1) and the maximum permitted number of instrumented thread objects is not greater than the number of background threads, the table will be empty.

The Performance Schema supports `TRUNCATE TABLE` for status variable tables as follows:

- `global_status`: Resets thread, account, host, and user status. Resets global status variables except those that the server never resets.
- `session_status`: Not supported.
- `status_by_thread`: Aggregates status for all threads to the global status and account status, then resets thread status. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 25.11.15 Performance Schema Summary Tables

Summary tables provide aggregated information for terminated events over time. The tables in this group summarize event data in different ways.

### Wait Event Summaries

- `events_waits_summary_by_account_by_event_name`: Wait events per account and event name

- [events\\_waits\\_summary\\_by\\_host\\_by\\_event\\_name](#): Wait events per host name and event name
- [events\\_waits\\_summary\\_by\\_instance](#): Wait events per instance
- [events\\_waits\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Wait events per thread and event name
- [events\\_waits\\_summary\\_by\\_user\\_by\\_event\\_name](#): Wait events per user name and event name
- [events\\_waits\\_summary\\_global\\_by\\_event\\_name](#): Wait events per event name

## Stage Summaries

- [events\\_stages\\_summary\\_by\\_account\\_by\\_event\\_name](#): Stage events per account and event name
- [events\\_stages\\_summary\\_by\\_host\\_by\\_event\\_name](#): Stage events per host name and event name
- [events\\_stages\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Stage waits per thread and event name
- [events\\_stages\\_summary\\_by\\_user\\_by\\_event\\_name](#): Stage events per user name and event name
- [events\\_stages\\_summary\\_global\\_by\\_event\\_name](#): Stage waits per event name

## Statement Summaries

- [events\\_statements\\_summary\\_by\\_account\\_by\\_event\\_name](#): Statement events per account and event name
- [events\\_statements\\_summary\\_by\\_digest](#): Statement events per schema and digest value
- [events\\_statements\\_summary\\_by\\_host\\_by\\_event\\_name](#): Statement events per host name and event name
- [events\\_statements\\_summary\\_by\\_program](#): Statement events per stored program (stored procedures and functions, triggers, and events)
- [events\\_statements\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Statement events per thread and event name
- [events\\_statements\\_summary\\_by\\_user\\_by\\_event\\_name](#): Statement events per user name and event name
- [events\\_statements\\_summary\\_global\\_by\\_event\\_name](#): Statement events per event name
- [prepared\\_statements\\_instances](#): Prepared statement instances and statistics

## Transaction Summaries

- [events\\_transactions\\_summary\\_by\\_account\\_by\\_event\\_name](#): Transaction events per account and event name
- [events\\_transactions\\_summary\\_by\\_host\\_by\\_event\\_name](#): Transaction events per host name and event name
- [events\\_transactions\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Transaction events per thread and event name
- [events\\_transactions\\_summary\\_by\\_user\\_by\\_event\\_name](#): Transaction events per user name and event name

- [events\\_transactions\\_summary\\_global\\_by\\_event\\_name](#): Transaction events per event name

## Object Wait Summaries

- [objects\\_summary\\_global\\_by\\_type](#): Object summaries

## File I/O Summaries

- [file\\_summary\\_by\\_event\\_name](#): File events per event name
- [file\\_summary\\_by\\_instance](#): File events per file instance

## Table I/O and Lock Wait Summaries

- [table\\_io\\_waits\\_summary\\_by\\_index\\_usage](#): Table I/O waits per index
- [table\\_io\\_waits\\_summary\\_by\\_table](#): Table I/O waits per table
- [table\\_lock\\_waits\\_summary\\_by\\_table](#): Table lock waits per table

## Socket Summaries

- [socket\\_summary\\_by\\_instance](#): Socket waits and I/O per instance
- [socket\\_summary\\_by\\_event\\_name](#): Socket waits and I/O per event name

## Memory Summaries

- [memory\\_summary\\_by\\_account\\_by\\_event\\_name](#): Memory operations per account and event name
- [memory\\_summary\\_by\\_host\\_by\\_event\\_name](#): Memory operations per host and event name
- [memory\\_summary\\_by\\_thread\\_by\\_event\\_name](#): Memory operations per thread and event name
- [memory\\_summary\\_by\\_user\\_by\\_event\\_name](#): Memory operations per user and event name
- [memory\\_summary\\_global\\_by\\_event\\_name](#): Memory operations globally per event name

## Status Variable Summaries

- [status\\_by\\_account](#): Status variables per account
- [status\\_by\\_host](#): Status variables per host name
- [status\\_by\\_user](#): Status variables per user name

Each summary table has grouping columns that determine how to group the data to be aggregated, and summary columns that contain the aggregated values. Tables that summarize events in similar ways often have similar sets of summary columns and differ only in the grouping columns used to determine how events are aggregated.

Summary tables can be truncated with [TRUNCATE TABLE](#). Generally, the effect is to reset the summary columns to 0 or [NULL](#), not to remove rows. This enables you to clear collected values and restart aggregation. That might be useful, for example, after you have made a runtime configuration change. Exceptions to this truncation behavior are noted in individual summary table sections.

### 25.11.15.1 Wait Event Summary Tables

The Performance Schema maintains tables for collecting current and recent wait events, and aggregates that information in summary tables. [Section 25.11.4, “Performance Schema Wait Event Tables”](#) describes the events on which wait summaries are based. See that discussion for information

about the content of wait events, the current and recent wait event tables, and how to control wait event collection, which is disabled by default.

Example wait event summary information:

```
mysql> SELECT *
      FROM performance_schema.events_waits_summary_global_by_event_name\G
...
***** 6. row *****
EVENT_NAME: wait/synch/mutex/sql/BINARY_LOG::LOCK_index
COUNT_STAR: 8
SUM_TIMER_WAIT: 2119302
MIN_TIMER_WAIT: 196092
AVG_TIMER_WAIT: 264912
MAX_TIMER_WAIT: 569421
...
***** 9. row *****
EVENT_NAME: wait/synch/mutex/sql/hash_filo::lock
COUNT_STAR: 69
SUM_TIMER_WAIT: 16848828
MIN_TIMER_WAIT: 0
AVG_TIMER_WAIT: 244185
MAX_TIMER_WAIT: 735345
...
```

Each wait event summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the [setup\\_instruments](#) table:

- [events\\_waits\\_summary\\_by\\_account\\_by\\_event\\_name](#) has [EVENT\\_NAME](#), [USER](#), and [HOST](#) columns. Each row summarizes events for a given account (user and host combination) and event name.
- [events\\_waits\\_summary\\_by\\_host\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [HOST](#) columns. Each row summarizes events for a given host and event name.
- [events\\_waits\\_summary\\_by\\_instance](#) has [EVENT\\_NAME](#) and [OBJECT\\_INSTANCE\\_BEGIN](#) columns. Each row summarizes events for a given event name and object. If an instrument is used to create multiple instances, each instance has a unique [OBJECT\\_INSTANCE\\_BEGIN](#) value and is summarized separately in this table.
- [events\\_waits\\_summary\\_by\\_thread\\_by\\_event\\_name](#) has [THREAD\\_ID](#) and [EVENT\\_NAME](#) columns. Each row summarizes events for a given thread and event name.
- [events\\_waits\\_summary\\_by\\_user\\_by\\_event\\_name](#) has [EVENT\\_NAME](#) and [USER](#) columns. Each row summarizes events for a given user and event name.
- [events\\_waits\\_summary\\_global\\_by\\_event\\_name](#) has an [EVENT\\_NAME](#) column. Each row summarizes events for a given event name. An instrument might be used to create multiple instances of the instrumented object. For example, if there is an instrument for a mutex that is created for each connection, there are as many instances as there are connections. The summary row for the instrument summarizes over all these instances.

Each wait event summary table has these summary columns containing aggregated values:

- [COUNT\\_STAR](#)

The number of summarized events. This value includes all events, whether timed or nontimed.

- [SUM\\_TIMER\\_WAIT](#)

The total wait time of the summarized timed events. This value is calculated only for timed events because nontimed events have a wait time of [NULL](#). The same is true for the other [xxx\\_TIMER\\_WAIT](#) values.

- `MIN_TIMER_WAIT`

The minimum wait time of the summarized timed events.

- `AVG_TIMER_WAIT`

The average wait time of the summarized timed events.

- `MAX_TIMER_WAIT`

The maximum wait time of the summarized timed events.

`TRUNCATE TABLE` is permitted for wait summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each wait summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_waits_summary_global_by_event_name`. For details, see [Section 25.11.8, “Performance Schema Connection Tables”](#).

## 25.11.15.2 Stage Summary Tables

The Performance Schema maintains tables for collecting current and recent stage events, and aggregates that information in summary tables. [Section 25.11.5, “Performance Schema Stage Event Tables”](#) describes the events on which stage summaries are based. See that discussion for information about the content of stage events, the current and recent stage event tables, and how to control stage event collection, which is disabled by default.

Example stage event summary information:

```
mysql> SELECT *
      FROM performance_schema.events_stages_summary_global_by_event_name\G
...
***** 5. row *****
EVENT_NAME: stage/sql/checking permissions
COUNT_STAR: 57
SUM_TIMER_WAIT: 26501888880
MIN_TIMER_WAIT: 7317456
AVG_TIMER_WAIT: 464945295
MAX_TIMER_WAIT: 12858936792
...
***** 9. row *****
EVENT_NAME: stage/sql/closing tables
COUNT_STAR: 37
SUM_TIMER_WAIT: 662606568
MIN_TIMER_WAIT: 1593864
AVG_TIMER_WAIT: 17907891
MAX_TIMER_WAIT: 437977248
...
```

Each stage summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_stages_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_stages_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.

- `events_stages_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_stages_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_stages_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each stage summary table has these summary columns containing aggregated values: `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, and `MAX_TIMER_WAIT`. These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 25.11.15.1, “Wait Event Summary Tables”](#)), except that the stage summary tables aggregate events from `events_stages_current` rather than `events_waits_current`.

`TRUNCATE TABLE` is permitted for stage summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each stage summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_stages_summary_global_by_event_name`. For details, see [Section 25.11.8, “Performance Schema Connection Tables”](#).

### 25.11.15.3 Statement Summary Tables

The Performance Schema maintains tables for collecting current and recent statement events, and aggregates that information in summary tables. [Section 25.11.6, “Performance Schema Statement Event Tables”](#) describes the events on which statement summaries are based. See that discussion for information about the content of statement events, the current and recent statement event tables, and how to control statement event collection, which is partially disabled by default.

Example statement event summary information:

```
mysql> SELECT *
      FROM performance_schema.events_statements_summary_global_by_event_name\G
***** 1. row *****
      EVENT_NAME: statement/sql/select
      COUNT_STAR: 25
      SUM_TIMER_WAIT: 1535983999000
      MIN_TIMER_WAIT: 209823000
      AVG_TIMER_WAIT: 61439359000
      MAX_TIMER_WAIT: 1363397650000
      SUM_LOCK_TIME: 20186000000
      SUM_ERRORS: 0
      SUM_WARNINGS: 0
      SUM_ROWS_AFFECTED: 0
      SUM_ROWS_SENT: 388
      SUM_ROWS_EXAMINED: 370
      SUM_CREATED_TMP_DISK_TABLES: 0
      SUM_CREATED_TMP_TABLES: 0
      SUM_SELECT_FULL_JOIN: 0
      SUM_SELECT_FULL_RANGE_JOIN: 0
      SUM_SELECT_RANGE: 0
      SUM_SELECT_RANGE_CHECK: 0
      SUM_SELECT_SCAN: 6
      SUM_SORT_MERGE_PASSES: 0
      SUM_SORT_RANGE: 0
      SUM_SORT_ROWS: 0
      SUM_SORT_SCAN: 0
      SUM_NO_INDEX_USED: 6
```

```
SUM_NO_GOOD_INDEX_USED: 0
```

```
...
```

Each statement summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_statements_summary_by_account_by_event_name` has `EVENT_NAME`, `USER`, and `HOST` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_statements_summary_by_digest` has `SCHEMA_NAME` and `DIGEST` columns. Each row summarizes events per schema and digest value. (The `DIGEST_TEXT` column contains the corresponding normalized statement digest text, but is neither a grouping nor a summary column.)

The maximum number of rows in the table is autosized at server startup. To set this maximum explicitly, set the `performance_schema_digests_size` system variable at server startup.

- `events_statements_summary_by_host_by_event_name` has `EVENT_NAME` and `HOST` columns. Each row summarizes events for a given host and event name.
- `events_statements_summary_by_program` has `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME` columns. Each row summarizes events for a given stored program (stored procedure or function, trigger, or event).
- `events_statements_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_statements_summary_by_user_by_event_name` has `EVENT_NAME` and `USER` columns. Each row summarizes events for a given user and event name.
- `events_statements_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `prepared_statements_instances` has an `OBJECT_INSTANCE_BEGIN` column. Each row summarizes events for a given prepared statement.

Each statement summary table has these summary columns containing aggregated values (with exceptions as noted):

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 25.11.15.1, “Wait Event Summary Tables”](#)), except that the statement summary tables aggregate events from `events_statements_current` rather than `events_waits_current`.

The `prepared_statements_instances` table does not have these columns.

- `SUM_xxx`

The aggregate of the corresponding `xxx` column in the `events_statements_current` table. For example, the `SUM_LOCK_TIME` and `SUM_ERRORS` columns in statement summary tables are the aggregates of the `LOCK_TIME` and `ERRORS` columns in `events_statements_current` table.

The `events_statements_summary_by_digest` table has these additional summary columns:

- `FIRST_SEEN`, `LAST_SEEN`

Timestamps indicating when statements with the given digest value were first seen and most recently seen.

The `events_statements_summary_by_program` table has these additional summary columns:

- `COUNT_STATEMENTS`, `SUM_STATEMENTS_WAIT`, `MIN_STATEMENTS_WAIT`, `AVG_STATEMENTS_WAIT`, `MAX_STATEMENTS_WAIT`

Statistics about nested statements invoked during stored program execution.

The `prepared_statements_instances` table has these additional summary columns:

- `COUNT_EXECUTE`, `SUM_TIMER_EXECUTE`, `MIN_TIMER_EXECUTE`, `AVG_TIMER_EXECUTE`, `MAX_TIMER_EXECUTE`

Aggregated statistics for executions of the prepared statement.

`TRUNCATE TABLE` is permitted for statement summary tables. It has these effects:

- For `events_statements_summary_by_digest`, it removes the rows.
- For other summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For other summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each statement summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_statements_summary_global_by_event_name`. For details, see [Section 25.11.8, “Performance Schema Connection Tables”](#).

## Statement Digest Aggregation Rules

If the `statements_digest` consumer is enabled, aggregation into `events_statements_summary_by_digest` occurs as follows when a statement completes. Aggregation is based on the `DIGEST` value computed for the statement.

- If a `events_statements_summary_by_digest` row already exists with the digest value for the statement that just completed, statistics for the statement are aggregated to that row. The `LAST_SEEN` column is updated to the current time.
- If no row has the digest value for the statement that just completed, and the table is not full, a new row is created for the statement. The `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time.
- If no row has the statement digest value for the statement that just completed, and the table is full, the statistics for the statement that just completed are added to a special “catch-all” row with `DIGEST = NULL`, which is created if necessary. If the row is created, the `FIRST_SEEN` and `LAST_SEEN` columns are initialized with the current time. Otherwise, the `LAST_SEEN` column is updated with the current time.

The row with `DIGEST = NULL` is maintained because Performance Schema tables have a maximum size due to memory constraints. The `DIGEST = NULL` row permits digests that do not match other rows to be counted even if the summary table is full, using a common “other” bucket. This row helps you estimate whether the digest summary is representative:

- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 5% of all digests shows that the digest summary table is very representative; the other rows cover 95% of the statements seen.
- A `DIGEST = NULL` row that has a `COUNT_STAR` value that represents 50% of all digests shows that the digest summary table is not very representative; the other rows cover only half the statements seen. Most likely the DBA should increase the maximum table size so that more of the rows counted in the `DIGEST = NULL` row would be counted using more specific rows instead. To do this, set the `performance_schema_digests_size` system variable to a larger value at server startup. The default size is 200.

## Stored Program Instrumentation Behavior

For stored program types for which instrumentation is enabled in the `setup_objects` table, `events_statements_summary_by_program` maintains statistics for stored programs as follows:

- A row is added for an object when it is first used in the server.
- The row for an object is removed when the object is dropped.
- Statistics are aggregated in the row for an object as it executes.

See also [Section 25.4.3, “Event Pre-Filtering”](#).

## 25.11.15.4 Transaction Summary Tables

The Performance Schema maintains tables for collecting current and recent transaction events, and aggregates that information in summary tables. [Section 25.11.7, “Performance Schema Transaction Tables”](#) describes the events on which transaction summaries are based. See that discussion for information about the content of transaction events, the current and recent transaction event tables, and how to control transaction event collection, which is disabled by default.

Example transaction event summary information:

```
mysql> SELECT *
      FROM performance_schema.events_transactions_summary_global_by_event_name
      LIMIT 1\G
***** 1. row *****
      EVENT_NAME: transaction
      COUNT_STAR: 5
      SUM_TIMER_WAIT: 19550092000
      MIN_TIMER_WAIT: 2954148000
      AVG_TIMER_WAIT: 3910018000
      MAX_TIMER_WAIT: 5486275000
      COUNT_READ_WRITE: 5
      SUM_TIMER_READ_WRITE: 19550092000
      MIN_TIMER_READ_WRITE: 2954148000
      AVG_TIMER_READ_WRITE: 3910018000
      MAX_TIMER_READ_WRITE: 5486275000
      COUNT_READ_ONLY: 0
      SUM_TIMER_READ_ONLY: 0
      MIN_TIMER_READ_ONLY: 0
      AVG_TIMER_READ_ONLY: 0
      MAX_TIMER_READ_ONLY: 0
```

Each transaction summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `events_transactions_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `events_transactions_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.
- `events_transactions_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `events_transactions_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `events_transactions_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each transaction summary table has these summary columns containing aggregated values:

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns are analogous to the columns of the same names in the wait event summary tables (see [Section 25.11.15.1, “Wait Event Summary Tables”](#)), except that the transaction summary tables aggregate events from `events_transactions_current` rather than `events_waits_current`. These columns summarize read-write and read-only transactions.

- `COUNT_READ_WRITE`, `SUM_TIMER_READ_WRITE`, `MIN_TIMER_READ_WRITE`, `AVG_TIMER_READ_WRITE`, `MAX_TIMER_READ_WRITE`

These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-write transactions only.

- `COUNT_READ_ONLY`, `SUM_TIMER_READ_ONLY`, `MIN_TIMER_READ_ONLY`, `AVG_TIMER_READ_ONLY`, `MAX_TIMER_READ_ONLY`

These are similar to the `COUNT_STAR` and `xxx_TIMER_WAIT` columns, but summarize read-only transactions only.

`TRUNCATE TABLE` is permitted for transaction summary tables. It has these effects:

- For summary tables not aggregated by account, host, or user, truncation resets the summary columns to zero rather than removing rows.
- For summary tables aggregated by account, host, or user, truncation removes rows for accounts, hosts, or users with no connections, and resets the summary columns to zero for the remaining rows.

In addition, each transaction summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `events_transactions_summary_global_by_event_name`. For details, see [Section 25.11.8, “Performance Schema Connection Tables”](#).

## Transaction Aggregation Rules

Transaction event collection occurs without regard to isolation level, access mode, or autocommit mode.

Read-write transactions are generally more resource intensive than read-only transactions, therefore transaction summary tables include separate aggregate columns for read-write and read-only transactions.

Resource requirements may also vary with transaction isolation level. However, presuming that only one isolation level would be used per server, aggregation by isolation level is not provided.

### 25.11.15.5 Object Wait Summary Table

The Performance Schema maintains the `objects_summary_global_by_type` table for aggregating object wait events.

Example object wait event summary information:

```
mysql> SELECT * FROM performance_schema.objects_summary_global_by_type\G
...
***** 3. row *****
OBJECT_TYPE: TABLE
OBJECT_SCHEMA: test
OBJECT_NAME: t
COUNT_STAR: 3
SUM_TIMER_WAIT: 263126976
MIN_TIMER_WAIT: 1522272
AVG_TIMER_WAIT: 87708678
MAX_TIMER_WAIT: 258428280
...
***** 10. row *****
```

```

OBJECT_TYPE: TABLE
OBJECT_SCHEMA: mysql
OBJECT_NAME: user
COUNT_STAR: 14
SUM_TIMER_WAIT: 365567592
MIN_TIMER_WAIT: 1141704
AVG_TIMER_WAIT: 26111769
MAX_TIMER_WAIT: 334783032
...

```

The `objects_summary_global_by_type` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. Each row summarizes events for the given object.

`objects_summary_global_by_type` has the same summary columns as the `events_waits_summary_by_xxx` tables. See [Section 25.11.15.1, “Wait Event Summary Tables”](#).

`TRUNCATE TABLE` is permitted for the object summary table. It resets the summary columns to zero rather than removing rows.

### 25.11.15.6 File I/O Summary Tables

The Performance Schema maintains file I/O summary tables that aggregate information about I/O operations.

Example file I/O event summary information:

```

mysql> SELECT * FROM performance_schema.file_summary_by_event_name\G
...
***** 2. row *****
          EVENT_NAME: wait/io/file/sql/binlog
          COUNT_STAR: 31
          SUM_TIMER_WAIT: 8243784888
          MIN_TIMER_WAIT: 0
          AVG_TIMER_WAIT: 265928484
          MAX_TIMER_WAIT: 6490658832
...
mysql> SELECT * FROM performance_schema.file_summary_by_instance\G
...
***** 2. row *****
          FILE_NAME: /var/mysql/share/english/errmsg.sys
          EVENT_NAME: wait/io/file/sql/ERRMSG
          EVENT_NAME: wait/io/file/sql/ERRMSG
          OBJECT_INSTANCE_BEGIN: 4686193384
          COUNT_STAR: 5
          SUM_TIMER_WAIT: 13990154448
          MIN_TIMER_WAIT: 26349624
          AVG_TIMER_WAIT: 2798030607
          MAX_TIMER_WAIT: 8150662536
...

```

Each file I/O summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `file_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.
- `file_summary_by_instance` has `FILE_NAME`, `EVENT_NAME`, and `OBJECT_INSTANCE_BEGIN` columns. Each row summarizes events for a given file and event name.

Each file I/O summary table has the following summary columns containing aggregated values. Some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`, `SUM_NUMBER_OF_BYTES_READ`

These columns aggregate all read operations, including `FGETS`, `FGETC`, `FREAD`, and `READ`.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`, `SUM_NUMBER_OF_BYTES_WRITE`

These columns aggregate all write operations, including `FPUTS`, `FPUTC`, `FPRINTF`, `VFPRINTF`, `FWRITE`, and `PWRITE`.

- `COUNT_MISC`, `SUM_TIMER_MISC`, `MIN_TIMER_MISC`, `AVG_TIMER_MISC`, `MAX_TIMER_MISC`

These columns aggregate all other I/O operations, including `CREATE`, `DELETE`, `OPEN`, `CLOSE`, `STREAM_OPEN`, `STREAM_CLOSE`, `SEEK`, `TELL`, `FLUSH`, `STAT`, `FSTAT`, `CHSIZE`, `RENAME`, and `SYNC`. There are no byte counts for these operations.

`TRUNCATE TABLE` is permitted for file I/O summary tables. It resets the summary columns to zero rather than removing rows.

The MySQL server uses several techniques to avoid I/O operations by caching information read from files, so it is possible that statements you might expect to result in I/O events will not. You may be able to ensure that I/O does occur by flushing caches or restarting the server to reset its state.

### 25.11.15.7 Table I/O and Lock Wait Summary Tables

The following sections describe the table I/O and lock wait summary tables:

- `table_io_waits_summary_by_index_usage`: Table I/O waits per index
- `table_io_waits_summary_by_table`: Table I/O waits per table
- `table_lock_waits_summary_by_table`: Table lock waits per table

#### The `table_io_waits_summary_by_table` Table

The `table_io_waits_summary_by_table` table aggregates all table I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table.

The `table_io_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_io_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all writes hold the sum of the corresponding columns that aggregate inserts, updates, and deletes. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all I/O operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read operations. They are the same as the sum of the corresponding `xxx_FETCH` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write operations. They are the same as the sum of the corresponding `xxx_INSERT`, `xxx_UPDATE`, and `xxx_DELETE` columns.

- `COUNT_FETCH`, `SUM_TIMER_FETCH`, `MIN_TIMER_FETCH`, `AVG_TIMER_FETCH`, `MAX_TIMER_FETCH`

These columns aggregate all fetch operations.

- `COUNT_INSERT`, `SUM_TIMER_INSERT`, `MIN_TIMER_INSERT`, `AVG_TIMER_INSERT`, `MAX_TIMER_INSERT`

These columns aggregate all insert operations.

- `COUNT_UPDATE`, `SUM_TIMER_UPDATE`, `MIN_TIMER_UPDATE`, `AVG_TIMER_UPDATE`, `MAX_TIMER_UPDATE`

These columns aggregate all update operations.

- `COUNT_DELETE`, `SUM_TIMER_DELETE`, `MIN_TIMER_DELETE`, `AVG_TIMER_DELETE`, `MAX_TIMER_DELETE`

These columns aggregate all delete operations.

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. Truncating this table also truncates the `table_io_waits_summary_by_index_usage` table.

### The `table_io_waits_summary_by_index_usage` Table

The `table_io_waits_summary_by_index_usage` table aggregates all table index I/O wait events, as generated by the `wait/io/table/sql/handler` instrument. The grouping is by table index.

The columns of `table_io_waits_summary_by_index_usage` are nearly identical to `table_io_waits_summary_by_table`. The only difference is the additional group column, `INDEX_NAME`, which corresponds to the name of the index that was used when the table I/O wait event was recorded:

- A value of `PRIMARY` indicates that table I/O used the primary index.
- A value of `NULL` means that table I/O used no index.
- Inserts are counted against `INDEX_NAME = NULL`.

`TRUNCATE TABLE` is permitted for table I/O summary tables. It resets the summary columns to zero rather than removing rows. This table is also truncated by truncation of the `table_io_waits_summary_by_table` table. A DDL operation that changes the index structure of a table may cause the per-index statistics to be reset.

### The `table_lock_waits_summary_by_table` Table

The `table_lock_waits_summary_by_table` table aggregates all table lock wait events, as generated by the `wait/lock/table/sql/handler` instrument. The grouping is by table.

This table contains information about internal and external locks:

- An internal lock corresponds to a lock in the SQL layer. This is currently implemented by a call to `thr_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```

read normal
read with shared locks
read high priority
read no insert
write allow write
write concurrent insert
write delayed
write low priority
write normal

```

- An external lock corresponds to a lock in the storage engine layer. This is currently implemented by a call to `handler::external_lock()`. In event rows, these locks are distinguished by the `OPERATION` column, which has one of these values:

```

read external
write external

```

The `table_lock_waits_summary_by_table` table has these grouping columns to indicate how the table aggregates events: `OBJECT_TYPE`, `OBJECT_SCHEMA`, and `OBJECT_NAME`. These columns have the same meaning as in the `events_waits_current` table. They identify the table to which the row applies.

`table_lock_waits_summary_by_table` has the following summary columns containing aggregated values. As indicated in the column descriptions, some columns are more general and have values that are the same as the sum of the values of more fine-grained columns. For example, columns that aggregate all locks hold the sum of the corresponding columns that aggregate read and write locks. In this way, aggregations at higher levels are available directly without the need for user-defined views that sum lower-level columns.

- `COUNT_STAR`, `SUM_TIMER_WAIT`, `MIN_TIMER_WAIT`, `AVG_TIMER_WAIT`, `MAX_TIMER_WAIT`

These columns aggregate all lock operations. They are the same as the sum of the corresponding `xxx_READ` and `xxx_WRITE` columns.

- `COUNT_READ`, `SUM_TIMER_READ`, `MIN_TIMER_READ`, `AVG_TIMER_READ`, `MAX_TIMER_READ`

These columns aggregate all read-lock operations. They are the same as the sum of the corresponding `xxx_READ_NORMAL`, `xxx_READ_WITH_SHARED_LOCKS`, `xxx_READ_HIGH_PRIORITY`, and `xxx_READ_NO_INSERT` columns.

- `COUNT_WRITE`, `SUM_TIMER_WRITE`, `MIN_TIMER_WRITE`, `AVG_TIMER_WRITE`, `MAX_TIMER_WRITE`

These columns aggregate all write-lock operations. They are the same as the sum of the corresponding `xxx_WRITE_ALLOW_WRITE`, `xxx_WRITE_CONCURRENT_INSERT`, `xxx_WRITE_LOW_PRIORITY`, and `xxx_WRITE_NORMAL` columns.

- `COUNT_READ_NORMAL`, `SUM_TIMER_READ_NORMAL`, `MIN_TIMER_READ_NORMAL`, `AVG_TIMER_READ_NORMAL`, `MAX_TIMER_READ_NORMAL`

These columns aggregate internal read locks.

- `COUNT_READ_WITH_SHARED_LOCKS`, `SUM_TIMER_READ_WITH_SHARED_LOCKS`, `MIN_TIMER_READ_WITH_SHARED_LOCKS`, `AVG_TIMER_READ_WITH_SHARED_LOCKS`, `MAX_TIMER_READ_WITH_SHARED_LOCKS`

These columns aggregate internal read locks.

- `COUNT_READ_HIGH_PRIORITY`, `SUM_TIMER_READ_HIGH_PRIORITY`, `MIN_TIMER_READ_HIGH_PRIORITY`, `AVG_TIMER_READ_HIGH_PRIORITY`, `MAX_TIMER_READ_HIGH_PRIORITY`

These columns aggregate internal read locks.

- `COUNT_READ_NO_INSERT`, `SUM_TIMER_READ_NO_INSERT`, `MIN_TIMER_READ_NO_INSERT`, `AVG_TIMER_READ_NO_INSERT`, `MAX_TIMER_READ_NO_INSERT`

These columns aggregate internal read locks.

- `COUNT_READ_EXTERNAL`, `SUM_TIMER_READ_EXTERNAL`, `MIN_TIMER_READ_EXTERNAL`, `AVG_TIMER_READ_EXTERNAL`, `MAX_TIMER_READ_EXTERNAL`

These columns aggregate external read locks.

- `COUNT_WRITE_ALLOW_WRITE`, `SUM_TIMER_WRITE_ALLOW_WRITE`, `MIN_TIMER_WRITE_ALLOW_WRITE`, `AVG_TIMER_WRITE_ALLOW_WRITE`, `MAX_TIMER_WRITE_ALLOW_WRITE`

These columns aggregate internal write locks.

- `COUNT_WRITE_CONCURRENT_INSERT`, `SUM_TIMER_WRITE_CONCURRENT_INSERT`, `MIN_TIMER_WRITE_CONCURRENT_INSERT`, `AVG_TIMER_WRITE_CONCURRENT_INSERT`, `MAX_TIMER_WRITE_CONCURRENT_INSERT`

These columns aggregate internal write locks.

- `COUNT_WRITE_LOW_PRIORITY`, `SUM_TIMER_WRITE_LOW_PRIORITY`, `MIN_TIMER_WRITE_LOW_PRIORITY`, `AVG_TIMER_WRITE_LOW_PRIORITY`, `MAX_TIMER_WRITE_LOW_PRIORITY`

These columns aggregate internal write locks.

- `COUNT_WRITE_NORMAL`, `SUM_TIMER_WRITE_NORMAL`, `MIN_TIMER_WRITE_NORMAL`, `AVG_TIMER_WRITE_NORMAL`, `MAX_TIMER_WRITE_NORMAL`

These columns aggregate internal write locks.

- `COUNT_WRITE_EXTERNAL`, `SUM_TIMER_WRITE_EXTERNAL`, `MIN_TIMER_WRITE_EXTERNAL`, `AVG_TIMER_WRITE_EXTERNAL`, `MAX_TIMER_WRITE_EXTERNAL`

These columns aggregate external write locks.

`TRUNCATE TABLE` is permitted for table lock summary tables. It resets the summary columns to zero rather than removing rows.

### 25.11.15.8 Socket Summary Tables

These socket summary tables aggregate timer and byte count information for socket operations:

- `socket_summary_by_event_name`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instrument.
- `socket_summary_by_instance`: Aggregate timer and byte count statistics generated by the `wait/io/socket/*` instruments for all socket I/O operations, per socket instance. When a connection terminates, the row in `socket_summary_by_instance` corresponding to it is deleted.

The socket summary tables do not aggregate waits generated by `idle` events while sockets are waiting for the next request from the client. For `idle` event aggregations, use the wait-event summary tables; see [Section 25.11.15.1, “Wait Event Summary Tables”](#).

Each socket summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `socket_summary_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

- [socket\\_summary\\_by\\_instance](#) has an [OBJECT\\_INSTANCE\\_BEGIN](#) column. Each row summarizes events for a given object.

Each socket summary table has these summary columns containing aggregated values:

- [COUNT\\_STAR](#), [SUM\\_TIMER\\_WAIT](#), [MIN\\_TIMER\\_WAIT](#), [AVG\\_TIMER\\_WAIT](#), [MAX\\_TIMER\\_WAIT](#)

These columns aggregate all operations.

- [COUNT\\_READ](#), [SUM\\_TIMER\\_READ](#), [MIN\\_TIMER\\_READ](#), [AVG\\_TIMER\\_READ](#), [MAX\\_TIMER\\_READ](#), [SUM\\_NUMBER\\_OF\\_BYTES\\_READ](#)

These columns aggregate all receive operations ([RECV](#), [RECVFROM](#), and [RECVMSG](#)).

- [COUNT\\_WRITE](#), [SUM\\_TIMER\\_WRITE](#), [MIN\\_TIMER\\_WRITE](#), [AVG\\_TIMER\\_WRITE](#), [MAX\\_TIMER\\_WRITE](#), [SUM\\_NUMBER\\_OF\\_BYTES\\_WRITE](#)

These columns aggregate all send operations ([SEND](#), [SENDTO](#), and [SENDMSG](#)).

- [COUNT\\_MISC](#), [SUM\\_TIMER\\_MISC](#), [MIN\\_TIMER\\_MISC](#), [AVG\\_TIMER\\_MISC](#), [MAX\\_TIMER\\_MISC](#)

These columns aggregate all other socket operations, such as [CONNECT](#), [LISTEN](#), [ACCEPT](#), [CLOSE](#), and [SHUTDOWN](#). There are no byte counts for these operations.

The [socket\\_summary\\_by\\_instance](#) table also has an [EVENT\\_NAME](#) column that indicates the class of the socket: [client\\_connection](#), [server\\_tcpip\\_socket](#), [server\\_unix\\_socket](#). This column can be grouped on to isolate, for example, client activity from that of the server listening sockets.

[TRUNCATE TABLE](#) is permitted for socket summary tables. Except for [events\\_statements\\_summary\\_by\\_digest](#), it resets the summary columns to zero rather than removing rows.

### 25.11.15.9 Memory Summary Tables

The Performance Schema instruments memory usage and aggregates memory usage statistics, detailed by these factors:

- Type of memory used (various caches, internal buffers, and so forth)
- Thread, account, user, host indirectly performing the memory operation

The Performance Schema instruments the following aspects of memory use

- Memory sizes used
- Operation counts
- Low and high water marks

Memory sizes help to understand or tune the memory consumption of the server.

Operation counts help to understand or tune the overall pressure the server is putting on the memory allocator, which has an impact on performance. Allocating a single byte one million times is not the same as allocating one million bytes a single time; tracking both sizes and counts can expose the difference.

Low and high water marks are critical to detect workload spikes, overall workload stability, and possible memory leaks.

Memory summary tables do not contain timing information because memory events are not timed.

For information about collecting memory usage data, see [Memory Instrumentation Behavior](#).

Example memory event summary information:

```
mysql> SELECT *
      FROM performance_schema.memory_summary_global_by_event_name
      WHERE EVENT_NAME = 'memory/sql/TABLE'\G
***** 1. row *****
      EVENT_NAME: memory/sql/TABLE
      COUNT_ALLOC: 1381
      COUNT_FREE: 924
      SUM_NUMBER_OF_BYTES_ALLOC: 2059873
      SUM_NUMBER_OF_BYTES_FREE: 1407432
      LOW_COUNT_USED: 0
      CURRENT_COUNT_USED: 457
      HIGH_COUNT_USED: 461
      LOW_NUMBER_OF_BYTES_USED: 0
      CURRENT_NUMBER_OF_BYTES_USED: 652441
      HIGH_NUMBER_OF_BYTES_USED: 669269
```

Each memory summary table has one or more grouping columns to indicate how the table aggregates events. Event names refer to names of event instruments in the `setup_instruments` table:

- `memory_summary_by_account_by_event_name` has `USER`, `HOST`, and `EVENT_NAME` columns. Each row summarizes events for a given account (user and host combination) and event name.
- `memory_summary_by_host_by_event_name` has `HOST` and `EVENT_NAME` columns. Each row summarizes events for a given host and event name.
- `memory_summary_by_thread_by_event_name` has `THREAD_ID` and `EVENT_NAME` columns. Each row summarizes events for a given thread and event name.
- `memory_summary_by_user_by_event_name` has `USER` and `EVENT_NAME` columns. Each row summarizes events for a given user and event name.
- `memory_summary_global_by_event_name` has an `EVENT_NAME` column. Each row summarizes events for a given event name.

Each memory summary table has these summary columns containing aggregated values:

- `COUNT_ALLOC`, `COUNT_FREE`

The aggregated numbers of calls to memory-allocation and memory-free functions.

- `SUM_NUMBER_OF_BYTES_ALLOC`, `SUM_NUMBER_OF_BYTES_FREE`

The aggregated sizes of allocated and freed memory blocks.

- `CURRENT_COUNT_USED`

The aggregated number of currently allocated blocks that have not been freed yet. This is a convenience column, equal to `COUNT_ALLOC - COUNT_FREE`.

- `CURRENT_NUMBER_OF_BYTES_USED`

The aggregated size of currently allocated memory blocks that have not been freed yet. This is a convenience column, equal to `SUM_NUMBER_OF_BYTES_ALLOC - SUM_NUMBER_OF_BYTES_FREE`.

- `LOW_COUNT_USED`, `HIGH_COUNT_USED`

The low and high water marks corresponding to the `CURRENT_COUNT_USED` column.

- `LOW_NUMBER_OF_BYTES_USED`, `HIGH_NUMBER_OF_BYTES_USED`

The low and high water marks corresponding to the `CURRENT_NUMBER_OF_BYTES_USED` column.

`TRUNCATE TABLE` is permitted for memory summary tables. It has these effects:

- In general, truncation resets the baseline for statistics, but does not change the server state. That is, truncating a memory table does not free memory.
- `COUNT_ALLOC` and `COUNT_FREE` are reset to a new baseline, by reducing each counter by the same value.
- Likewise, `SUM_NUMBER_OF_BYTES_ALLOC` and `SUM_NUMBER_OF_BYTES_FREE` are reset to a new baseline.
- `LOW_COUNT_USED` and `HIGH_COUNT_USED` are reset to `CURRENT_COUNT_USED`.
- `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` are reset to `CURRENT_NUMBER_OF_BYTES_USED`.

In addition, each memory summary table that is aggregated by account, host, user, or thread is implicitly truncated by truncation of the connection table on which it depends, or truncation of `memory_summary_global_by_event_name`. For details, see [Section 25.11.8, “Performance Schema Connection Tables”](#).

## Memory Instrumentation Behavior

Memory instruments are listed in the `setup_instruments` table and have names of the form `memory/code_area/instrument_name`. Most memory instrumentation is disabled by default.

Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for internal buffers in the Performance Schema itself. The `memory/performance_schema/` instruments are built in, always enabled, and cannot be disabled at startup or runtime. Built-in memory instruments are displayed only in the `memory_summary_global_by_event_name` table.

To control memory instrumentation state at server startup, use lines like these in your `my.cnf` file:

- Enable:

```
[mysqld]
performance-schema-instrument='memory/%=ON'
```

- Disable:

```
[mysqld]
performance-schema-instrument='memory/%=OFF'
```

To control memory instrumentation state at runtime, update the `ENABLED` column of the relevant instruments in the `setup_instruments` table:

- Enable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'YES'
WHERE NAME LIKE 'memory/%';
```

- Disable:

```
UPDATE performance_schema.setup_instruments
SET ENABLED = 'NO'
WHERE NAME LIKE 'memory/%';
```

For memory instruments, the `TIMED` column in `setup_instruments` is ignored because memory operations are not timed.

When a thread in the server executes a memory allocation that has been instrumented, these rules apply:

- If the thread is not instrumented or the memory instrument is not enabled, the memory block allocated is not instrumented.
- Otherwise (that is, both the thread and the instrument are enabled), the memory block allocated is instrumented.

For deallocation, these rules apply:

- If a memory allocation operation was instrumented, the corresponding free operation is instrumented, regardless of the current instrument or thread enabled status.
- If a memory allocation operation was not instrumented, the corresponding free operation is not instrumented, regardless of the current instrument or thread enabled status.

For the per-thread statistics, the following rules apply.

When an instrumented memory block of size *N* is allocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_ALLOC`: Increased by 1
- `CURRENT_COUNT_USED`: Increased by 1
- `HIGH_COUNT_USED`: Increased if `CURRENT_COUNT_USED` is a new maximum
- `SUM_NUMBER_OF_BYTES_ALLOC`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Increased by *N*
- `HIGH_NUMBER_OF_BYTES_USED`: Increased if `CURRENT_NUMBER_OF_BYTES_USED` is a new maximum

When an instrumented memory block is deallocated, the Performance Schema makes these updates to memory summary table columns:

- `COUNT_FREE`: Increased by 1
- `CURRENT_COUNT_USED`: Decreased by 1
- `LOW_COUNT_USED`: Decreased if `CURRENT_COUNT_USED` is a new minimum
- `SUM_NUMBER_OF_BYTES_FREE`: Increased by *N*
- `CURRENT_NUMBER_OF_BYTES_USED`: Decreased by *N*
- `LOW_NUMBER_OF_BYTES_USED`: Decreased if `CURRENT_NUMBER_OF_BYTES_USED` is a new minimum

For higher-level aggregates (global, by account, by user, by host), the same rules apply as expected for low and high water marks.

- `LOW_COUNT_USED` and `LOW_NUMBER_OF_BYTES_USED` are lower estimates. The value reported by the Performance Schema is guaranteed to be less than or equal to the lowest count or size of memory effectively used at runtime.
- `HIGH_COUNT_USED` and `HIGH_NUMBER_OF_BYTES_USED` are higher estimates. The value reported by the Performance Schema is guaranteed to be greater than or equal to the highest count or size of memory effectively used at runtime.

For lower estimates in summary tables other than `memory_summary_global_by_event_name`, it is possible for values to go negative if memory ownership is transferred between threads.

Here is an example of estimate computation; but note that estimate implementation is subject to change:

Thread 1 uses memory in the range from 1MB to 2MB during execution, as reported by the `LOW_NUMBER_OF_BYTES_USED` and `HIGH_NUMBER_OF_BYTES_USED` columns of the `memory_summary_by_thread_by_event_name` table.

Thread 2 uses memory in the range from 10MB to 12MB during execution, as reported likewise.

When these two threads belong to the same user account, the per-account summary estimates that this account used memory in the range from 11MB to 14MB. That is, the `LOW_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `LOW_NUMBER_OF_BYTES_USED` (assuming the worst case). Likewise, the `HIGH_NUMBER_OF_BYTES_USED` for the higher level aggregate is the sum of each `HIGH_NUMBER_OF_BYTES_USED` (assuming the worst case).

11MB is a lower estimate that can occur only if both threads hit the low usage mark at the same time.

14MB is a higher estimate that can occur only if both threads hit the high usage mark at the same time.

The real memory usage for this account could have been in the range from 11.5MB to 13.5MB.

For capacity planning, reporting the worst case is actually the desired behavior, as it shows what can potentially happen when sessions are uncorrelated, which is typically the case.

## 25.11.15.10 Status Variable Summary Tables

### Note

The value of the `show_compatibility_56` system variable affects the information available from the tables described here. For details, see the description of that variable in [Section 5.1.7, “Server System Variables”](#).

The Performance Schema makes status variable information available in the tables described in [Section 25.11.14, “Performance Schema Status Variable Tables”](#). It also makes aggregated status variable information available in summary tables, described here. Each status variable summary table has one or more grouping columns to indicate how the table aggregates status values:

- `status_by_account` has `USER`, `HOST`, and `VARIABLE_NAME` columns to summarize status variables by account.
- `status_by_host` has `HOST` and `VARIABLE_NAME` columns to summarize status variables by the host from which clients connected.
- `status_by_user` has `USER` and `VARIABLE_NAME` columns to summarize status variables by client user name.

Each status variable summary table has this summary column containing aggregated values:

- `VARIABLE_VALUE`

The aggregated status variable value for active and terminated sessions.

The meaning of “account” in these tables is similar to its meaning in the MySQL grant tables in the `mysql` system database, in the sense that the term refers to a combination of user and host values. They differ in that, for grant tables, the host part of an account can be a pattern, whereas for Performance Schema tables, the host value is always a specific nonpattern host name.

Account status is collected when sessions terminate. The session status counters are added to the global status counters and the corresponding account status counters. If account statistics are not collected, the session status is added to host and user status, if host and user status are collected.

Account, host, and user statistics are not collected if the `performance_schema_accounts_size`, `performance_schema_hosts_size`, and `performance_schema_users_size` system variables, respectively, are set to 0.

The Performance Schema supports `TRUNCATE TABLE` for status variable summary tables as follows; in all cases, status for active sessions is unaffected:

- `status_by_account`: Aggregates account status from terminated sessions to user and host status, then resets account status.
- `status_by_host`: Resets aggregated host status from terminated sessions.
- `status_by_user`: Resets aggregated user status from terminated sessions.

`FLUSH STATUS` adds the session status from all active sessions to the global status variables, resets the status of all active sessions, and resets account, host, and user status values aggregated from disconnected sessions.

## 25.11.16 Performance Schema Miscellaneous Tables

The following sections describe tables that do not fall into the table categories discussed in the preceding sections:

- `host_cache`: Information from the internal host cache
- `performance_timers`: Which event timers are available
- `threads`: Information about server threads

### 25.11.16.1 The `host_cache` Table

The `host_cache` table provides access to the contents of the host cache, which contains client host name and IP address information and is used to avoid DNS lookups. (See [Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”](#).) The `host_cache` table exposes the contents of the host cache so that it can be examined using `SELECT` statements. The Performance Schema must be enabled or this table is empty.

The `host_cache` table has these columns:

- `IP`

The IP address of the client that connected to the server, expressed as a string.

- `HOST`

The resolved DNS host name for that client IP, or `NULL` if the name is unknown.

- `HOST_VALIDATED`

Whether the IP-to-host name-to-IP DNS resolution was performed successfully for the client IP. If `HOST_VALIDATED` is `YES`, the `HOST` column is used as the host name corresponding to the IP so that calls to DNS can be avoided. While `HOST_VALIDATED` is `NO`, DNS resolution is attempted again for each connection attempt, until it eventually completes with either a valid result or a permanent error. This information enables the server to avoid caching bad or missing host names during temporary DNS failures, which would affect clients forever.

- `SUM_CONNECT_ERRORS`

The number of connection errors that are deemed “blocking” (assessed against the `max_connect_errors` system variable). Only protocol handshake errors are counted, and only for hosts that passed validation (`HOST_VALIDATED = YES`).

- `COUNT_HOST_BLOCKED_ERRORS`

The number of connections that were blocked because `SUM_CONNECT_ERRORS` exceeded the value of the `max_connect_errors` system variable.

- [COUNT\\_NAMEINFO\\_TRANSIENT\\_ERRORS](#)

The number of transient errors during IP-to-host name DNS resolution.

- [COUNT\\_NAMEINFO\\_PERMANENT\\_ERRORS](#)

The number of permanent errors during IP-to-host name DNS resolution.

- [COUNT\\_FORMAT\\_ERRORS](#)

The number of host name format errors. MySQL does not perform matching of [Host](#) column values in the `mysql.user` table against host names for which one or more of the initial components of the name are entirely numeric, such as `1.2.example.com`. The client IP address is used instead. For the rationale why this type of matching does not occur, see [Section 6.2.3, “Specifying Account Names”](#).

- [COUNT\\_ADDRINFO\\_TRANSIENT\\_ERRORS](#)

The number of transient errors during host name-to-IP reverse DNS resolution.

- [COUNT\\_ADDRINFO\\_PERMANENT\\_ERRORS](#)

The number of permanent errors during host name-to-IP reverse DNS resolution.

- [COUNT\\_FCRDNS\\_ERRORS](#)

The number of forward-confirmed reverse DNS errors. These errors occur when IP-to-host name-to-IP DNS resolution produces an IP address that does not match the client originating IP address.

- [COUNT\\_HOST\\_ACL\\_ERRORS](#)

The number of errors that occur because no users are permitted to connect from the client host. In such cases, the server returns `ER_HOST_NOT_PRIVILEGED` and does not even ask for a user name or password.

- [COUNT\\_NO\\_AUTH\\_PLUGIN\\_ERRORS](#)

The number of errors due to requests for an unavailable authentication plugin. A plugin can be unavailable if, for example, it was never loaded or a load attempt failed.

- [COUNT\\_AUTH\\_PLUGIN\\_ERRORS](#)

The number of errors reported by authentication plugins.

An authentication plugin can report different error codes to indicate the root cause of a failure. Depending on the type of error, one of these columns is incremented: [COUNT\\_AUTHENTICATION\\_ERRORS](#), [COUNT\\_AUTH\\_PLUGIN\\_ERRORS](#), [COUNT\\_HANDSHAKE\\_ERRORS](#). New return codes are an optional extension to the existing plugin API. Unknown or unexpected plugin errors are counted in the [COUNT\\_AUTH\\_PLUGIN\\_ERRORS](#) column.

- [COUNT\\_HANDSHAKE\\_ERRORS](#)

The number of errors detected at the wire protocol level.

- [COUNT\\_PROXY\\_USER\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does not exist.

- [COUNT\\_PROXY\\_USER\\_ACL\\_ERRORS](#)

The number of errors detected when proxy user A is proxied to another user B who does exist but for whom A does not have the [PROXY](#) privilege.

- [COUNT\\_AUTHENTICATION\\_ERRORS](#)

The number of errors caused by failed authentication.

- `COUNT_SSL_ERRORS`

The number of errors due to SSL problems.

- `COUNT_MAX_USER_CONNECTIONS_ERRORS`

The number of errors caused by exceeding per-user connection quotas. See [Section 6.3.5, “Setting Account Resource Limits”](#).

- `COUNT_MAX_USER_CONNECTIONS_PER_HOUR_ERRORS`

The number of errors caused by exceeding per-user connections-per-hour quotas. See [Section 6.3.5, “Setting Account Resource Limits”](#).

- `COUNT_DEFAULT_DATABASE_ERRORS`

The number of errors related to the default database. For example, the database did not exist or the user had no privileges for accessing it.

- `COUNT_INIT_CONNECT_ERRORS`

The number of errors caused by execution failures of statements in the `init_connect` system variable value.

- `COUNT_LOCAL_ERRORS`

The number of errors local to the server implementation and not related to the network, authentication, or authorization. For example, out-of-memory conditions fall into this category.

- `COUNT_UNKNOWN_ERRORS`

The number of other, unknown errors not accounted for by other columns in this table. This column is reserved for future use, in case new error conditions must be reported, and if preserving the backward compatibility and table structure of the `host_cache` table is required.

- `FIRST_SEEN`

The timestamp of the first connection attempt seen from the client in the `IP` column.

- `LAST_SEEN`

The timestamp of the last connection attempt seen from the client in the `IP` column.

- `FIRST_ERROR_SEEN`

The timestamp of the first error seen from the client in the `IP` column.

- `LAST_ERROR_SEEN`

The timestamp of the last error seen from the client in the `IP` column.

`FLUSH HOSTS` and `TRUNCATE TABLE host_cache` have the same effect: They clear the host cache. Clearing the cache also removes rows from the `host_cache` table (because it is the visible representation of the cache) and unblocks any blocked hosts (see [Section B.5.2.5, “Host ‘host\\_name’ is blocked”](#).) `FLUSH HOSTS` requires the `RELOAD` privilege. `TRUNCATE TABLE` requires the `DROP` privilege for the `host_cache` table.

## 25.11.16.2 The `performance_timers` Table

The `performance_timers` table shows which event timers are available:

```
mysql> SELECT * FROM performance_schema.performance_timers;
```

TIMER_NAME	TIMER_FREQUENCY	TIMER_RESOLUTION	TIMER_OVERHEAD
CYCLE	2389029850	1	72
NANOSECOND	1000000000	1	112
MICROSECOND	1000000	1	136
MILLISECOND	1036	1	168
TICK	105	1	2416

If the values associated with a given timer name are `NULL`, that timer is not supported on your platform. The rows that do not contain `NULL` indicate which timers you can use in `setup_timers`. For an explanation of how event timing occurs, see [Section 25.4.1, “Performance Schema Event Timing”](#).

#### Note

As of MySQL 5.7.21, the Performance Schema `setup_timers` table is deprecated and is removed in MySQL 8.0, as is the `TICKS` row in the `performance_timers` table.

The `performance_timers` table has these columns:

- `TIMER_NAME`

The name by which to refer to the timer when configuring the `setup_timers` table.

- `TIMER_FREQUENCY`

The number of timer units per second. For a cycle timer, the frequency is generally related to the CPU speed. For example, on a system with a 2.4GHz processor, the `CYCLE` may be close to 2400000000.

- `TIMER_RESOLUTION`

Indicates the number of timer units by which timer values increase. If a timer has a resolution of 10, its value increases by 10 each time.

- `TIMER_OVERHEAD`

The minimal number of cycles of overhead to obtain one timing with the given timer. The Performance Schema determines this value by invoking the timer 20 times during initialization and picking the smallest value. The total overhead really is twice this amount because the instrumentation invokes the timer at the start and end of each event. The timer code is called only for timed events, so this overhead does not apply for nontimed events.

`TRUNCATE TABLE` is not permitted for the `performance_timers` table.

### 25.11.16.3 The threads Table

The `threads` table contains a row for each server thread. Each row contains information about a thread and indicates whether monitoring and historical event logging are enabled for it:

```
mysql> SELECT * FROM performance_schema.threads\G
***** 1. row *****
      THREAD_ID: 1
        NAME: thread/sql/main
        TYPE: BACKGROUND
PROCESSLIST_ID: NULL
PROCESSLIST_USER: NULL
PROCESSLIST_HOST: NULL
PROCESSLIST_DB: NULL
```

```

PROCESSLIST_COMMAND: NULL
PROCESSLIST_TIME: 80284
PROCESSLIST_STATE: NULL
PROCESSLIST_INFO: NULL
PARENT_THREAD_ID: NULL
ROLE: NULL
INSTRUMENTED: YES
HISTORY: YES
CONNECTION_TYPE: NULL
THREAD_OS_ID: 489803
...
***** 4. row *****
THREAD_ID: 51
NAME: thread/sql/one_connection
TYPE: FOREGROUND
PROCESSLIST_ID: 34
PROCESSLIST_USER: isabella
PROCESSLIST_HOST: localhost
PROCESSLIST_DB: performance_schema
PROCESSLIST_COMMAND: Query
PROCESSLIST_TIME: 0
PROCESSLIST_STATE: Sending data
PROCESSLIST_INFO: SELECT * FROM performance_schema.threads
PARENT_THREAD_ID: 1
ROLE: NULL
INSTRUMENTED: YES
HISTORY: YES
CONNECTION_TYPE: SSL/TLS
THREAD_OS_ID: 755399
...

```

When the Performance Schema initializes, it populates the `threads` table based on the threads in existence then. Thereafter, a new row is added each time the server creates a thread.

The `INSTRUMENTED` and `HISTORY` column values for new threads are determined by the contents of the `setup_actors` table. For information about how to use the `setup_actors` table to control these columns, see [Section 25.4.6, “Pre-Filtering by Thread”](#).

Removal of rows from the `threads` table occurs when threads end. For a thread associated with a client session, removal occurs when the session ends. If a client has auto-reconnect enabled and the session reconnects after a disconnect, the session becomes associated with a new row in the `threads` table that has a different `PROCESSLIST_ID` value. The initial `INSTRUMENTED` and `HISTORY` values for the new thread may be different from those of the original thread: The `setup_actors` table may have changed in the meantime, and if the `INSTRUMENTED` or `HISTORY` value for the original thread was changed after the row was initialized, the change does not carry over to the new thread.

The `threads` table columns with names having a prefix of `PROCESSLIST_` provide information similar to that available from the `INFORMATION_SCHEMA.PROCESSLIST` table or the `SHOW PROCESSLIST` statement. Thus, all three sources provide thread-monitoring information. Use of `threads` differs from use of the other two sources in these ways:

- Access to `threads` does not require a mutex and has minimal impact on server performance. `INFORMATION_SCHEMA.PROCESSLIST` and `SHOW PROCESSLIST` have negative performance consequences because they require a mutex.
- `threads` provides additional information for each thread, such as whether it is a foreground or background thread, and the location within the server associated with the thread.
- `threads` provides information about background threads, so it can be used to monitor activity the other thread information sources cannot.
- You can enable or disable thread monitoring (that is, whether events executed by the thread are instrumented) and historical event logging. To control the initial `INSTRUMENTED` and `HISTORY` values for new foreground threads, use the `setup_actors` table. To control these aspects of existing threads, set the `INSTRUMENTED` and `HISTORY` columns of `threads` table rows. (For more

information about the conditions under which thread monitoring and historical event logging occur, see the descriptions of the [INSTRUMENTED](#) and [HISTORY](#) columns.)

For these reasons, DBAs who perform server monitoring using [INFORMATION\\_SCHEMA.PROCESSLIST](#) or [SHOW PROCESSLIST](#) may wish to monitor using the [threads](#) table instead.

#### Note

For [INFORMATION\\_SCHEMA.PROCESSLIST](#) and [SHOW PROCESSLIST](#), information about threads for other users is shown only if the current user has the [PROCESS](#) privilege. That is not true of the [threads](#) table; all rows are shown to any user who has the [SELECT](#) privilege for the table. Users who should not be able to see threads for other users should not be given that privilege.

The [threads](#) table has these columns:

- [THREAD\\_ID](#)

A unique thread identifier.

- [NAME](#)

The name associated with the thread instrumentation code in the server. For example, [thread/sql/one\\_connection](#) corresponds to the thread function in the code responsible for handling a user connection, and [thread/sql/main](#) stands for the [main\(\)](#) function of the server.

- [TYPE](#)

The thread type, either [FOREGROUND](#) or [BACKGROUND](#). User connection threads are foreground threads. Threads associated with internal server activity are background threads. Examples are internal [InnoDB](#) threads, “binlog dump” threads sending information to slaves, and slave I/O and SQL threads.

- [PROCESSLIST\\_ID](#)

For threads that are displayed in the [INFORMATION\\_SCHEMA.PROCESSLIST](#) table, this is the same value displayed in the [ID](#) column of that table. It is also the value displayed in the [Id](#) column of [SHOW PROCESSLIST](#) output, and the value that [CONNECTION\\_ID\(\)](#) would return within that thread.

For background threads (threads not associated with a user connection), [PROCESSLIST\\_ID](#) is [NULL](#), so the values are not unique.

- [PROCESSLIST\\_USER](#)

The user associated with a foreground thread, [NULL](#) for a background thread.

- [PROCESSLIST\\_HOST](#)

The host name of the client associated with a foreground thread, [NULL](#) for a background thread.

Unlike the [HOST](#) column of the [INFORMATION\\_SCHEMA.PROCESSLIST](#) table or the [Host](#) column of [SHOW PROCESSLIST](#) output, the [PROCESSLIST\\_HOST](#) column does not include the port number for TCP/IP connections. To obtain this information from the Performance Schema, enable the socket instrumentation (which is not enabled by default) and examine the [socket\\_instances](#) table:

```
mysql> SELECT * FROM performance_schema.setup_instruments
      WHERE NAME LIKE 'wait/io/socket%';
+-----+-----+-----+
| NAME                                     | ENABLED | TIMED |
+-----+-----+-----+
| wait/io/socket/sql/server_tcpip_socket | NO      | NO    |
+-----+-----+-----+
```

```

| wait/io/socket/sql/server_unix_socket | NO | NO |
| wait/io/socket/sql/client_connection | NO | NO |
+-----+-----+-----+
3 rows in set (0.01 sec)

mysql> UPDATE performance_schema.setup_instruments
      SET ENABLED='YES'
      WHERE NAME LIKE 'wait/io/socket%';
Query OK, 3 rows affected (0.00 sec)
Rows matched: 3  Changed: 3  Warnings: 0

mysql> SELECT * FROM performance_schema.socket_instances\G
***** 1. row *****
      EVENT_NAME: wait/io/socket/sql/client_connection
OBJECT_INSTANCE_BEGIN: 140612577298432
      THREAD_ID: 31
      SOCKET_ID: 53
           IP: ::ffff:127.0.0.1
          PORT: 55642
          STATE: ACTIVE
...

```

- [PROCESSLIST\\_DB](#)

The default database for the thread, or [NULL](#) if there is none.

- [PROCESSLIST\\_COMMAND](#)

For foreground threads, the type of command the thread is executing on behalf of the client, or [Sleep](#) if the session is idle. For descriptions of thread commands, see [Section 8.14, “Examining Thread Information”](#). The value of this column corresponds to the [COM\\_xxx](#) commands of the client/server protocol and [Com\\_xxx](#) status variables. See [Section 5.1.9, “Server Status Variables”](#)

Background threads do not execute commands on behalf of clients, so this column may be [NULL](#).

- [PROCESSLIST\\_TIME](#)

The time in seconds that the thread has been in its current state.

- [PROCESSLIST\\_STATE](#)

An action, event, or state that indicates what the thread is doing. For descriptions of [PROCESSLIST\\_STATE](#) values, see [Section 8.14, “Examining Thread Information”](#). If the value is [NULL](#), the thread may correspond to an idle client session or the work it is doing is not instrumented with stages.

Most states correspond to very quick operations. If a thread stays in a given state for many seconds, there might be a problem that bears investigation.

- [PROCESSLIST\\_INFO](#)

The statement the thread is executing, or [NULL](#) if it is not executing any statement. The statement might be the one sent to the server, or an innermost statement if the statement executes other statements. For example, if a [CALL](#) statement executes a stored procedure that is executing a [SELECT](#) statement, the [PROCESSLIST\\_INFO](#) value shows the [SELECT](#) statement.

- [PARENT\\_THREAD\\_ID](#)

If this thread is a subthread (spawned by another thread), this is the [THREAD\\_ID](#) value of the spawning thread.

- [ROLE](#)

Unused.

- [INSTRUMENTED](#)

Whether events executed by the thread are instrumented. The value is [YES](#) or [NO](#).

- For foreground threads, the initial [INSTRUMENTED](#) value is determined by whether the user account associated with the thread matches any row in the [setup\\_actors](#) table. Matching is based on the values of the [PROCESSLIST\\_USER](#) and [PROCESSLIST\\_HOST](#) columns.

If the thread spawns a subthread, matching occurs again for the [threads](#) table row created for the subthread.

- For background threads, [INSTRUMENTED](#) is [YES](#) by default. [setup\\_actors](#) is not consulted because there is no associated user for background threads.
- For any thread, its [INSTRUMENTED](#) value can be changed during the lifetime of the thread.

For monitoring of events executed by the thread to occur, these things must be true:

- The [thread\\_instrumentation](#) consumer in the [setup\\_consumers](#) table must be [YES](#).
- The [threads.INSTRUMENTED](#) column must be [YES](#).
- Monitoring occurs only for those thread events produced from instruments that have the [ENABLED](#) column set to [YES](#) in the [setup\\_instruments](#) table.

- [HISTORY](#)

Whether to log historical events for the thread. The value is [YES](#) or [NO](#).

- For foreground threads, the initial [HISTORY](#) value is determined by whether the user account associated with the thread matches any row in the [setup\\_actors](#) table. Matching is based on the values of the [PROCESSLIST\\_USER](#) and [PROCESSLIST\\_HOST](#) columns.

If the thread spawns a subthread, matching occurs again for the [threads](#) table row created for the subthread.

- For background threads, [HISTORY](#) is [YES](#) by default. [setup\\_actors](#) is not consulted because there is no associated user for background threads.
- For any thread, its [HISTORY](#) value can be changed during the lifetime of the thread.

For historical event logging for the thread to occur, these things must be true:

- The appropriate history-related consumers in the [setup\\_consumers](#) table must be enabled. For example, wait event logging in the [events\\_waits\\_history](#) and [events\\_waits\\_history\\_long](#) tables requires the corresponding [events\\_waits\\_history](#) and [events\\_waits\\_history\\_long](#) consumers to be [YES](#).
- The [threads.HISTORY](#) column must be [YES](#).
- Logging occurs only for those thread events produced from instruments that have the [ENABLED](#) column set to [YES](#) in the [setup\\_instruments](#) table.

- [CONNECTION\\_TYPE](#)

The protocol used to establish the connection, or [NULL](#) for background threads. Permitted values are [TCP/IP](#) (TCP/IP connection established without encryption), [SSL/TLS](#) (TCP/IP connection established with encryption), [Socket](#) (Unix socket file connection), [Named Pipe](#) (Windows named pipe connection), and [Shared Memory](#) (Windows shared memory connection).

- [THREAD\\_OS\\_ID](#)

The thread or task identifier as defined by the underlying operating system, if there is one:

- When a MySQL thread is associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains the operating system thread ID.
- When a MySQL thread is not associated with the same operating system thread for its lifetime, `THREAD_OS_ID` contains `NULL`. This is typical for user sessions when the thread pool plugin is used (see [Section 5.5.3, “MySQL Enterprise Thread Pool”](#)).

For Windows, `THREAD_OS_ID` corresponds to the thread ID visible in Process Explorer (<https://technet.microsoft.com/en-us/sysinternals/bb896653.aspx>).

For Linux, `THREAD_OS_ID` corresponds to the value of the `gettid()` function. This value is exposed, for example, using the `perf` or `ps -L` commands, or in the `proc` file system (`/proc/[pid]/task/[tid]`). For more information, see the `perf-stat(1)`, `ps(1)`, and `proc(5)` man pages.

`TRUNCATE TABLE` is not permitted for the `threads` table.

## 25.12 Performance Schema Option and Variable Reference

**Table 25.3 Performance Schema Variable Reference**

Name	Cmd-Line	Option File	System Var	Status Var	Var Scope	Dy
<a href="#">performance_schema</a>	Yes	Yes	Yes		Global	No

## 25.13 Performance Schema Command Options

Performance Schema parameters can be specified at server startup on the command line or in option files to configure Performance Schema instruments and consumers. Runtime configuration is also possible in many cases (see [Section 25.4, “Performance Schema Runtime Configuration”](#)), but startup configuration must be used when runtime configuration is too late to affect instruments that have already been initialized during the startup process.

Performance Schema consumers and instruments can be configured at startup using the following syntax. For additional details, see [Section 25.3, “Performance Schema Startup Configuration”](#).

- `--performance-schema-consumer-consumer_name=value`

Configure a Performance Schema consumer. Consumer names in the `setup_consumers` table use underscores, but for consumers set at startup, dashes and underscores within the name are equivalent. Options for configuring individual consumers are detailed later in this section.

- `--performance-schema-instrument=instrument_name=value`

Configure a Performance Schema instrument. The name may be given as a pattern to configure instruments that match the pattern.

The following items configure individual consumers:

- `--performance-schema-consumer-events-stages-current=value`

Configure the `events-stages-current` consumer.

- `--performance-schema-consumer-events-stages-history=value`

Configure the `events-stages-history` consumer.

- `--performance-schema-consumer-events-stages-history-long=value`

Configure the `events-stages-history-long` consumer.

- `--performance-schema-consumer-events-statements-current=value`

Configure the `events-statements-current` consumer.

- `--performance-schema-consumer-events-statements-history=value`

Configure the `events-statements-history` consumer.

- `--performance-schema-consumer-events-statements-history-long=value`

Configure the `events-statements-history-long` consumer.

- `--performance-schema-consumer-events-transactions-current=value`

Configure the Performance Schema `events-transactions-current` consumer.

- `--performance-schema-consumer-events-transactions-history=value`

Configure the Performance Schema `events-transactions-history` consumer.

- `--performance-schema-consumer-events-transactions-history-long=value`

Configure the Performance Schema `events-transactions-history-long` consumer.

- `--performance-schema-consumer-events-waits-current=value`

Configure the `events-waits-current` consumer.

- `--performance-schema-consumer-events-waits-history=value`

Configure the `events-waits-history` consumer.

- `--performance-schema-consumer-events-waits-history-long=value`

Configure the `events-waits-history-long` consumer.

- `--performance-schema-consumer-global-instrumentation=value`

Configure the `global-instrumentation` consumer.

- `--performance-schema-consumer-statements-digest=value`

Configure the `statements-digest` consumer.

- `--performance-schema-consumer-thread-instrumentation=value`

Configure the `thread-instrumentation` consumer.

## 25.14 Performance Schema System Variables

The Performance Schema implements several system variables that provide configuration information:

```
mysql> SHOW VARIABLES LIKE 'perf%';
```

Variable_name	Value
performance_schema	ON
performance_schema_accounts_size	-1
performance_schema_digests_size	10000
performance_schema_events_stages_history_long_size	10000
performance_schema_events_stages_history_size	10
performance_schema_events_statements_history_long_size	10000
performance_schema_events_statements_history_size	10
performance_schema_events_transactions_history_long_size	10000
performance_schema_events_transactions_history_size	10
performance_schema_events_waits_history_long_size	10000
performance_schema_events_waits_history_size	10
performance_schema_hosts_size	-1
performance_schema_max_cond_classes	80
performance_schema_max_cond_instances	-1
performance_schema_max_digest_length	1024
performance_schema_max_file_classes	50
performance_schema_max_file_handles	32768
performance_schema_max_file_instances	-1
performance_schema_max_index_stat	-1
performance_schema_max_memory_classes	320
performance_schema_max_metadata_locks	-1
performance_schema_max_mutex_classes	200
performance_schema_max_mutex_instances	-1
performance_schema_max_prepared_statements_instances	-1
performance_schema_max_program_instances	-1
performance_schema_max_rwlock_classes	40
performance_schema_max_rwlock_instances	-1
performance_schema_max_socket_classes	10
performance_schema_max_socket_instances	-1

performance_schema_max_sql_text_length	1024
performance_schema_max_stage_classes	150
performance_schema_max_statement_classes	192
performance_schema_max_statement_stack	10
performance_schema_max_table_handles	-1
performance_schema_max_table_instances	-1
performance_schema_max_table_lock_stat	-1
performance_schema_max_thread_classes	50
performance_schema_max_thread_instances	-1
performance_schema_session_connect_attrs_size	512
performance_schema_setup_actors_size	-1
performance_schema_setup_objects_size	-1
performance_schema_users_size	-1

Performance Schema system variables can be set at server startup on the command line or in option files, and many can be set at runtime. See [Section 25.12, “Performance Schema Option and Variable Reference”](#).

The Performance Schema automatically sizes the values of several of its parameters at server startup if they are not set explicitly. For more information, see [Section 25.3, “Performance Schema Startup Configuration”](#).

Performance Schema system variables have the following meanings:

- `performance_schema`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema=#</code>
<b>System Variable</b>	<code>performance_schema</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Boolean
<b>Default Value</b>	<code>ON</code>

The value of this variable is `ON` or `OFF` to indicate whether the Performance Schema is enabled. By default, the value is `ON`. At server startup, you can specify this variable with no value or a value of `ON` or 1 to enable it, or with a value of `OFF` or 0 to disable it.

Even when the Performance Schema is disabled, it continues to populate the `global_variables`, `session_variables`, `global_status`, and `session_status` tables. This occurs as necessary to permit the results for the `SHOW VARIABLES` and `SHOW STATUS` statements to be drawn from those tables, depending on the setting of the `show_compatibility_56` system variable.

- `performance_schema_accounts_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-accounts-size=#</code>
<b>System Variable</b>	<code>performance_schema_accounts_size</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value (&gt;= 5.7.6)</b>	<code>-1</code> (signifies autoscaling; do not assign this literal value)
<b>Default Value (&lt;= 5.7.5)</b>	<code>-1</code> (signifies autosizing; do not assign this literal value)

Property	Value
<b>Minimum Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Minimum Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)
<b>Maximum Value</b>	1048576

The number of rows in the `accounts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `accounts` table or status variable information in the `status_by_account` table.

- `performance_schema_digests_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-digests-size=#</code>
<b>System Variable</b>	<code>performance_schema_digests_size</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)
<b>Minimum Value</b>	-1
<b>Maximum Value</b>	1048576

The maximum number of rows in the `events_statements_summary_by_digest` table. If this maximum is exceeded such that a digest cannot be instrumented, the Performance Schema increments the `Performance_schema_digest_lost` status variable.

For more information about statement digesting, see [Section 25.9, “Performance Schema Statement Digests”](#).

- `performance_schema_events_stages_history_long_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-events-stages-history-long-size=#</code>
<b>System Variable</b>	<code>performance_schema_events_stages_history_lo</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_stages_history_long` table.

- `performance_schema_events_stages_history_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-events-stages-history-size=#</code>
<b>System Variable</b>	<code>performance_schema_events_stages_history_si</code>

Property	Value
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_stages_history` table.

- `performance_schema_events_statements_history_long_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-statements-history-long-size=#</code>
System Variable	<code>performance_schema_events_statements_history_1</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_statements_history_long` table.

- `performance_schema_events_statements_history_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-statements-history-size=#</code>
System Variable	<code>performance_schema_events_statements_history_s</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_statements_history` table.

- `performance_schema_events_transactions_history_long_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-transactions-history-long-size=#</code>
Introduced	5.7.3
System Variable	<code>performance_schema_events_transactions_history</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_transactions_history_long` table.

- `performance_schema_events_transactions_history_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-transactions-history-size=#</code>
Introduced	5.7.3
System Variable	<code>performance_schema_events_transactions_hist</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_transactions_history` table.

- `performance_schema_events_waits_history_long_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-waits-history-long-size=#</code>
System Variable	<code>performance_schema_events_waits_history_lon</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows in the `events_waits_history_long` table.

- `performance_schema_events_waits_history_size`

Property	Value
Command-Line Format	<code>--performance-schema-events-waits-history-size=#</code>
System Variable	<code>performance_schema_events_waits_history_siz</code>
Scope	Global
Dynamic	No
Type	Integer
Default Value	-1 (signifies autosizing; do not assign this literal value)

The number of rows per thread in the `events_waits_history` table.

- `performance_schema_hosts_size`

Property	Value
Command-Line Format	<code>--performance-schema-hosts-size=#</code>
System Variable	<code>performance_schema_hosts_size</code>

Property	Value
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)
<b>Minimum Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Minimum Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)
<b>Maximum Value</b>	1048576

The number of rows in the `hosts` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `hosts` table or status variable information in the `status_by_host` table.

- `performance_schema_max_cond_classes`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-cond-classes=#</code>
<b>System Variable</b>	<code>performance_schema_max_cond_classes</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	80
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of condition instruments.

- `performance_schema_max_cond_instances`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-cond-instances=#</code>
<b>System Variable</b>	<code>performance_schema_max_cond_instances</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented condition objects.

- `performance_schema_max_digest_length`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-digest-length=#</code>
<b>Introduced</b>	5.7.8
<b>System Variable</b>	<code>performance_schema_max_digest_length</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	1024
<b>Minimum Value</b>	0
<b>Maximum Value</b>	1048576

The maximum number of bytes available for storage of normalized statement digest values in the Performance Schema. This variable is related to `max_digest_length`; see the description of that variable in [Section 5.1.7, “Server System Variables”](#)

For more information about statement digesting, see [Section 25.9, “Performance Schema Statement Digests”](#).

- `performance_schema_max_file_classes`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-file-classes=#</code>
<b>System Variable</b>	<code>performance_schema_max_file_classes</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value (&gt;= 5.7.9)</b>	80
<b>Default Value (&lt;= 5.7.8)</b>	50
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of file instruments.

- `performance_schema_max_file_handles`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-file-handles=#</code>
<b>System Variable</b>	<code>performance_schema_max_file_handles</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	32768

The maximum number of opened file objects.

The value of `performance_schema_max_file_handles` should be greater than the value of `open_files_limit`: `open_files_limit` affects the maximum number of open file handles the server can support and `performance_schema_max_file_handles` affects how many of these file handles can be instrumented.

- `performance_schema_max_file_instances`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-file-instances=#</code>
<b>System Variable</b>	<code>performance_schema_max_file_instances</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented file objects.

- `performance_schema_max_index_stat`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-index-stat=#</code>
<b>Introduced</b>	5.7.6
<b>System Variable</b>	<code>performance_schema_max_index_stat</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)

The maximum number of indexes for which the Performance Schema maintains statistics. If this maximum is exceeded such that index statistics are lost, the Performance Schema increments the `Performance_schema_index_stat_lost` status variable. The default value is autosized using the value of `performance_schema_max_table_instances`.

- `performance_schema_max_memory_classes`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-memory-classes=#</code>
<b>Introduced</b>	5.7.2
<b>System Variable</b>	<code>performance_schema_max_memory_classes</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.5$ )	320

Property	Value
<b>Default Value</b> (<= 5.7.4)	250

The maximum number of memory instruments.

- [performance\\_schema\\_max\\_metadata\\_locks](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-metadata-locks=#</code>
<b>Introduced</b>	5.7.3
<b>System Variable</b>	<a href="#">performance_schema_max_metadata_locks</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)

The maximum number of metadata lock instruments. This value controls the size of the [metadata\\_locks](#) table. If this maximum is exceeded such that a metadata lock cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_metadata\\_lock\\_lost](#) status variable.

- [performance\\_schema\\_max\\_mutex\\_classes](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-mutex-classes=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_mutex_classes</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	200
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of mutex instruments.

- [performance\\_schema\\_max\\_mutex\\_instances](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-mutex-instances=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_mutex_instances</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer

Property	Value
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented mutex objects.

- `performance_schema_max_prepared_statements_instances`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-prepared-statements-instances=#</code>
<b>Introduced</b>	5.7.4
<b>System Variable</b>	<code>performance_schema_max_prepared_statements_instances</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)

The maximum number of rows in the `prepared_statements_instances` table. If this maximum is exceeded such that a prepared statement cannot be instrumented, the Performance Schema increments the `Performance_schema_prepared_statements_lost` status variable. The default value of this variable is autosized based on the value of the `max_prepared_stmt_count` system variable.

- `performance_schema_max_rwlock_classes`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-rwlock-classes=#</code>
<b>System Variable</b>	<code>performance_schema_max_rwlock_classes</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.3$ )	40
<b>Default Value</b> ( $\leq 5.7.2$ )	30
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of rwlock instruments.

- `performance_schema_max_program_instances`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-program-instances=#</code>

Property	Value
Introduced	5.7.2
System Variable	<a href="#">performance_schema_max_program_instances</a>
Scope	Global
Dynamic	No
Type	Integer
Default Value ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
Default Value ( $\leq 5.7.5$ )	5000

The maximum number of stored programs for which the Performance Schema maintains statistics. If this maximum is exceeded, the Performance Schema increments the [Performance\\_schema\\_program\\_lost](#) status variable.

- [performance\\_schema\\_max\\_rwlock\\_instances](#)

Property	Value
Command-Line Format	<code>--performance-schema-max-rwlock-instances=#</code>
System Variable	<a href="#">performance_schema_max_rwlock_instances</a>
Scope	Global
Dynamic	No
Type	Integer
Default Value ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
Default Value ( $\leq 5.7.5$ )	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented rwlock objects.

- [performance\\_schema\\_max\\_socket\\_classes](#)

Property	Value
Command-Line Format	<code>--performance-schema-max-socket-classes=#</code>
System Variable	<a href="#">performance_schema_max_socket_classes</a>
Scope	Global
Dynamic	No
Type	Integer
Default Value	10
Minimum Value	0
Maximum Value	256

The maximum number of socket instruments.

- [performance\\_schema\\_max\\_socket\\_instances](#)

Property	Value
Command-Line Format	<code>--performance-schema-max-socket-instances=#</code>

Property	Value
<b>System Variable</b>	<a href="#">performance_schema_max_socket_instances</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented socket objects.

- [performance\\_schema\\_max\\_sql\\_text\\_length](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-sql-text-length=#</code>
<b>Introduced</b>	5.7.6
<b>System Variable</b>	<a href="#">performance_schema_max_sql_text_length</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	1024
<b>Minimum Value</b>	0
<b>Maximum Value</b>	1048576

The maximum number of bytes used to store SQL statements in the [SQL\\_TEXT](#) column of the [events\\_statements\\_current](#), [events\\_statements\\_history](#), and [events\\_statements\\_history\\_long](#) statement event tables. Any bytes in excess of [performance\\_schema\\_max\\_sql\\_text\\_length](#) are discarded and do not appear in the [SQL\\_TEXT](#) column. Statements differing only after that many initial bytes are indistinguishable in this column.

Decreasing the [performance\\_schema\\_max\\_sql\\_text\\_length](#) value reduces memory use but causes more statements to become indistinguishable if they differ only at the end. Increasing the value increases memory use but permits longer statements to be distinguished.

- [performance\\_schema\\_max\\_stage\\_classes](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-stage-classes=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_stage_classes</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	150
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of stage instruments.

- [performance\\_schema\\_max\\_statement\\_classes](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-statement-classes=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_statement_classes</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)

The maximum number of statement instruments. The default value is calculated at server build time based on the number of commands in the client/server protocol and the number of SQL statement types supported by the server.

This variable should not be changed, unless to set it to 0 to disable all statement instrumentation and save all memory associated with it. Setting the variable to nonzero values other than the default has no benefit; in particular, values larger than the default cause more memory to be allocated than is needed.

- [performance\\_schema\\_max\\_statement\\_stack](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-statement-stack=#</code>
<b>Introduced</b>	5.7.2
<b>System Variable</b>	<a href="#">performance_schema_max_statement_stack</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	10

The maximum depth of nested stored program calls for which the Performance Schema maintains statistics. When this maximum is exceeded, the Performance Schema increments the [Performance\\_schema\\_nested\\_statement\\_lost](#) status variable for each stored program statement executed.

- [performance\\_schema\\_max\\_table\\_handles](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-table-handles=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_table_handles</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value (&gt;= 5.7.6)</b>	-1 (signifies autoscaling; do not assign this literal value)

Property	Value
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)

The maximum number of opened table objects. This value controls the size of the `table_handles` table. If this maximum is exceeded such that a table handle cannot be instrumented, the Performance Schema increments the `Performance_schema_table_handles_lost` status variable.

- `performance_schema_max_table_instances`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-table-instances=#</code>
<b>System Variable</b>	<code>performance_schema_max_table_instances</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented table objects.

- `performance_schema_max_table_lock_stat`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-table-lock-stat=#</code>
<b>Introduced</b>	5.7.6
<b>System Variable</b>	<code>performance_schema_max_table_lock_stat</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)

The maximum number of tables for which the Performance Schema maintains lock statistics. If this maximum is exceeded such that table lock statistics are lost, the Performance Schema increments the `Performance_schema_table_lock_stat_lost` status variable.

- `performance_schema_max_thread_classes`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-thread-classes=#</code>
<b>System Variable</b>	<code>performance_schema_max_thread_classes</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer

Property	Value
<b>Default Value</b>	50
<b>Minimum Value</b>	0
<b>Maximum Value</b>	256

The maximum number of thread instruments.

- [performance\\_schema\\_max\\_thread\\_instances](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-max-thread-instances=#</code>
<b>System Variable</b>	<a href="#">performance_schema_max_thread_instances</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)

The maximum number of instrumented thread objects. The value controls the size of the [threads](#) table. If this maximum is exceeded such that a thread cannot be instrumented, the Performance Schema increments the [Performance\\_schema\\_thread\\_instances\\_lost](#) status variable.

The [max\\_connections](#) system variable affects how many threads can run in the server. [performance\\_schema\\_max\\_thread\\_instances](#) affects how many of these running threads can be instrumented.

The [variables\\_by\\_thread](#) and [status\\_by\\_thread](#) tables contain system and status variable information only about foreground threads. If not all threads are instrumented by the Performance Schema, this table will miss some rows. In this case, the [Performance\\_schema\\_thread\\_instances\\_lost](#) status variable will be greater than zero.

- [performance\\_schema\\_session\\_connect\\_attrs\\_size](#)

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-session-connect-attrs-size=#</code>
<b>System Variable</b>	<a href="#">performance_schema_session_connect_attrs_si</a>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b>	-1 (signifies autosizing; do not assign this literal value)
<b>Minimum Value</b>	-1
<b>Maximum Value</b>	1048576

The amount of preallocated memory per thread reserved to hold connection attribute key/value pairs. If the aggregate size of connection attribute data sent by a client is larger than this amount, the Performance Schema truncates the attribute data, increments the [Performance\\_schema\\_session\\_connect\\_attrs\\_lost](#) status variable, and writes a message

to the error log indicating that truncation occurred if the `log_error_verbosity` system variable value is greater than 1.

The default value of `performance_schema_session_connect_attrs_size` is autosized at server startup. This value may be small, so if truncation occurs (`performance_schema_session_connect_attrs_lost` becomes nonzero), you may wish to set `performance_schema_session_connect_attrs_size` explicitly to a larger value.

Although the maximum permitted `performance_schema_session_connect_attrs_size` value is 1MB, the effective maximum is 64KB because the server imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. If a client attempts to send more than 64KB of attribute data, the server rejects the connection. For more information, see [Section 25.11.9, “Performance Schema Connection Attribute Tables”](#).

- `performance_schema_setup_actors_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-setup-actors-size=#</code>
<b>System Variable</b>	<code>performance_schema_setup_actors_size</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	100

The number of rows in the `setup_actors` table.

- `performance_schema_setup_objects_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-setup-objects-size=#</code>
<b>System Variable</b>	<code>performance_schema_setup_objects_size</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer
<b>Default Value</b> ( $\geq 5.7.6$ )	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> ( $\leq 5.7.5$ )	100

The number of rows in the `setup_objects` table.

- `performance_schema_users_size`

Property	Value
<b>Command-Line Format</b>	<code>--performance-schema-users-size=#</code>
<b>System Variable</b>	<code>performance_schema_users_size</code>
<b>Scope</b>	Global
<b>Dynamic</b>	No
<b>Type</b>	Integer

Property	Value
<b>Default Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Default Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)
<b>Minimum Value</b> (>= 5.7.6)	-1 (signifies autoscaling; do not assign this literal value)
<b>Minimum Value</b> (<= 5.7.5)	-1 (signifies autosizing; do not assign this literal value)
<b>Maximum Value</b>	1048576

The number of rows in the `users` table. If this variable is 0, the Performance Schema does not maintain connection statistics in the `users` table or status variable information in the `status_by_user` table.

## 25.15 Performance Schema Status Variables

The Performance Schema implements several status variables that provide information about instrumentation that could not be loaded or created due to memory constraints:

```
mysql> SHOW STATUS LIKE 'perf%';
```

Variable_name	Value
Performance_schema_accounts_lost	0
Performance_schema_cond_classes_lost	0
Performance_schema_cond_instances_lost	0
Performance_schema_file_classes_lost	0
Performance_schema_file_handles_lost	0
Performance_schema_file_instances_lost	0
Performance_schema_hosts_lost	0
Performance_schema_locker_lost	0
Performance_schema_mutex_classes_lost	0
Performance_schema_mutex_instances_lost	0
Performance_schema_rwlock_classes_lost	0
Performance_schema_rwlock_instances_lost	0
Performance_schema_socket_classes_lost	0
Performance_schema_socket_instances_lost	0
Performance_schema_stage_classes_lost	0
Performance_schema_statement_classes_lost	0
Performance_schema_table_handles_lost	0
Performance_schema_table_instances_lost	0
Performance_schema_thread_classes_lost	0
Performance_schema_thread_instances_lost	0
Performance_schema_users_lost	0

Performance Schema status variables have the following meanings:

- `Performance_schema_accounts_lost`

The number of times a row could not be added to the `accounts` table because it was full.

- `Performance_schema_cond_classes_lost`

How many condition instruments could not be loaded.

- `Performance_schema_cond_instances_lost`

How many condition instrument instances could not be created.

- `Performance_schema_digest_lost`

The number of digest instances that could not be instrumented in the `events_statements_summary_by_digest` table. This can be nonzero if the value of `performance_schema_digests_size` is too small.

- `Performance_schema_file_classes_lost`

How many file instruments could not be loaded.

- `Performance_schema_file_handles_lost`

How many file instrument instances could not be opened.

- `Performance_schema_file_instances_lost`

How many file instrument instances could not be created.

- `Performance_schema_hosts_lost`

The number of times a row could not be added to the `hosts` table because it was full.

- `Performance_schema_index_stat_lost`

The number of indexes for which statistics were lost. This can be nonzero if the value of `performance_schema_max_index_stat` is too small.

- `Performance_schema_locker_lost`

How many events are “lost” or not recorded, due to the following conditions:

- Events are recursive (for example, waiting for A caused a wait on B, which caused a wait on C).
- The depth of the nested events stack is greater than the limit imposed by the implementation.

Events recorded by the Performance Schema are not recursive, so this variable should always be 0.

- `Performance_schema_memory_classes_lost`

The number of times a memory instrument could not be loaded.

- `Performance_schema_metadata_lock_lost`

The number of metadata locks that could not be instrumented in the `metadata_locks` table. This can be nonzero if the value of `performance_schema_max_metadata_locks` is too small.

- `Performance_schema_mutex_classes_lost`

How many mutex instruments could not be loaded.

- `Performance_schema_mutex_instances_lost`

How many mutex instrument instances could not be created.

- `Performance_schema_nested_statement_lost`

The number of stored program statements for which statistics were lost. This can be nonzero if the value of `performance_schema_max_statement_stack` is too small.

- `Performance_schema_prepared_statements_lost`

The number of prepared statements that could not be instrumented in the `prepared_statements_instances` table. This can be nonzero if the value of `performance_schema_max_prepared_statements_instances` is too small.

- `Performance_schema_program_lost`

The number of stored programs for which statistics were lost. This can be nonzero if the value of `performance_schema_max_program_instances` is too small.

- `Performance_schema_rwlock_classes_lost`

How many rwlock instruments could not be loaded.

- `Performance_schema_rwlock_instances_lost`

How many rwlock instrument instances could not be created.

- `Performance_schema_session_connect_attrs_lost`

The number of connections for which connection attribute truncation has occurred. For a given connection, if the client sends connection attribute key/value pairs for which the aggregate size is larger than the reserved storage permitted by the value of the `performance_schema_session_connect_attrs_size` system variable, the Performance Schema truncates the attribute data and increments `Performance_schema_session_connect_attrs_lost`. If this value is nonzero, you may wish to set `performance_schema_session_connect_attrs_size` to a larger value.

For more information about connection attributes, see [Section 25.11.9, “Performance Schema Connection Attribute Tables”](#).

- `Performance_schema_socket_classes_lost`

How many socket instruments could not be loaded.

- `Performance_schema_socket_instances_lost`

How many socket instrument instances could not be created.

- `Performance_schema_stage_classes_lost`

How many stage instruments could not be loaded.

- `Performance_schema_statement_classes_lost`

How many statement instruments could not be loaded.

- `Performance_schema_table_handles_lost`

How many table instrument instances could not be opened. This can be nonzero if the value of `performance_schema_max_table_handles` is too small.

- `Performance_schema_table_instances_lost`

How many table instrument instances could not be created.

- `Performance_schema_table_lock_stat_lost`

The number of tables for which lock statistics were lost. This can be nonzero if the value of `performance_schema_max_table_lock_stat` is too small.

- `Performance_schema_thread_classes_lost`

How many thread instruments could not be loaded.

- `Performance_schema_thread_instances_lost`

The number of thread instances that could not be instrumented in the `threads` table. This can be nonzero if the value of `performance_schema_max_thread_instances` is too small.

- `performance_schema_users_lost`

The number of times a row could not be added to the `users` table because it was full.

For information on using these variables to check Performance Schema status, see [Section 25.7](#), “Performance Schema Status Monitoring”.

## 25.16 The Performance Schema Memory-Allocation Model

The Performance Schema uses this memory allocation model:

- May allocate memory at server startup
- May allocate additional memory during server operation
- Never free memory during server operation (although it might be recycled)
- Free all memory used at shutdown

The result is to relax memory constraints so that the Performance Schema can be used with less configuration, and to decrease the memory footprint so that consumption scales with server load. Memory used depends on the load actually seen, not the load estimated or explicitly configured for.

Several Performance Schema sizing parameters are autoscaled and need not be configured explicitly unless you want to establish an explicit limit on memory allocation:

```
performance_schema_accounts_size
performance_schema_hosts_size
performance_schema_max_cond_instances
performance_schema_max_file_instances
performance_schema_max_index_stat
performance_schema_max_metadata_locks
performance_schema_max_mutex_instances
performance_schema_max_prepared_statements_instances
performance_schema_max_program_instances
performance_schema_max_rwlock_instances
performance_schema_max_socket_instances
performance_schema_max_table_handles
performance_schema_max_table_instances
performance_schema_max_table_lock_stat
performance_schema_max_thread_instances
performance_schema_users_size
```

For an autoscaled parameter, configuration works like this:

- With the value set to -1 (the default), the parameter is autoscaled:
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer. The buffer size is unbounded, and may grow with the load.
- With the value set to 0:
  - The corresponding internal buffer is empty initially and no memory is allocated.
- With the value set to  $N > 0$ :
  - The corresponding internal buffer is empty initially and no memory is allocated.
  - As the Performance Schema collects data, memory is allocated in the corresponding buffer, until the buffer size reaches  $N$ .
  - Once the buffer size reaches  $N$ , no more memory is allocated. Data collected by the Performance Schema for this buffer is lost, and any corresponding “lost instance” counters are incremented.

To see how much memory the Performance Schema is using, check the instruments designed for that purpose. The Performance Schema allocates memory internally and associates each buffer with a dedicated instrument so that memory consumption can be traced to individual buffers. Instruments named with the prefix `memory/performance_schema/` expose how much memory is allocated for these internal buffers. The buffers are global to the server, so the instruments are displayed only in the `memory_summary_global_by_event_name` table, and not in other `memory_summary_by_XXX_by_event_name` tables.

This query shows the information associated with the memory instruments:

```
SELECT * FROM performance_schema.memory_summary_global_by_event_name
WHERE EVENT_NAME LIKE 'memory/performance_schema/%';
```

## 25.17 Performance Schema and Plugins

Removing a plugin with `UNINSTALL PLUGIN` does not affect information already collected for code in that plugin. Time spent executing the code while the plugin was loaded was still spent even if the plugin is unloaded later. The associated event information, including aggregate information, remains readable in `performance_schema` database tables. For additional information about the effect of plugin installation and removal, see [Section 25.7, “Performance Schema Status Monitoring”](#).

A plugin implementor who instruments plugin code should document its instrumentation characteristics to enable those who load the plugin to account for its requirements. For example, a third-party storage engine should include in its documentation how much memory the engine needs for mutex and other instruments.

## 25.18 Using the Performance Schema to Diagnose Problems

The Performance Schema is a tool to help a DBA do performance tuning by taking real measurements instead of “wild guesses.” This section demonstrates some ways to use the Performance Schema for this purpose. The discussion here relies on the use of event filtering, which is described in [Section 25.4.2, “Performance Schema Event Filtering”](#).

The following example provides one methodology that you can use to analyze a repeatable problem, such as investigating a performance bottleneck. To begin, you should have a repeatable use case where performance is deemed “too slow” and needs optimization, and you should enable all instrumentation (no pre-filtering at all).

1. Run the use case.
2. Using the Performance Schema tables, analyze the root cause of the performance problem. This analysis will rely heavily on post-filtering.
3. For problem areas that are ruled out, disable the corresponding instruments. For example, if analysis shows that the issue is not related to file I/O in a particular storage engine, disable the file I/O instruments for that engine. Then truncate the history and summary tables to remove previously collected events.
4. Repeat the process at step 1.

At each iteration, the Performance Schema output, particularly the `events_waits_history_long` table, will contain less and less “noise” caused by nonsignificant instruments, and given that this table has a fixed size, will contain more and more data relevant to the analysis of the problem at hand.

At each iteration, investigation should lead closer and closer to the root cause of the problem, as the “signal/noise” ratio will improve, making analysis easier.

5. Once a root cause of performance bottleneck is identified, take the appropriate corrective action, such as:

- Tune the server parameters (cache sizes, memory, and so forth).
  - Tune a query by writing it differently,
  - Tune the database schema (tables, indexes, and so forth).
  - Tune the code (this applies to storage engine or server developers only).
6. Start again at step 1, to see the effects of the changes on performance.

The `mutex_instances.LOCKED_BY_THREAD_ID` and `rwlock_instances.WRITE_LOCKED_BY_THREAD_ID` columns are extremely important for investigating performance bottlenecks or deadlocks. This is made possible by Performance Schema instrumentation as follows:

1. Suppose that thread 1 is stuck waiting for a mutex.
2. You can determine what the thread is waiting for:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_1;
```

Say the query result identifies that the thread is waiting for mutex A, found in `events_waits_current.OBJECT_INSTANCE_BEGIN`.

3. You can determine which thread is holding mutex A:

```
SELECT * FROM performance_schema.mutex_instances
WHERE OBJECT_INSTANCE_BEGIN = mutex_A;
```

Say the query result identifies that it is thread 2 holding mutex A, as found in `mutex_instances.LOCKED_BY_THREAD_ID`.

4. You can see what thread 2 is doing:

```
SELECT * FROM performance_schema.events_waits_current
WHERE THREAD_ID = thread_2;
```

## 25.18.1 Query Profiling Using Performance Schema

The following example demonstrates how to use Performance Schema statement events and stage events to retrieve data comparable to profiling information provided by `SHOW PROFILES` and `SHOW PROFILE` statements.

The `setup_actors` table can be used to limit the collection of historical events by host, user, or account to reduce runtime overhead and the amount of data collected in history tables. The first step of the example shows how to limit collection of historical events to a specific user.

Performance Schema displays event timer information in picoseconds (trillionths of a second) to normalize timing data to a standard unit. In the following example, `TIMER_WAIT` values are divided by 1000000000000 to show data in units of seconds. Values are also truncated to 6 decimal places to display data in the same format as `SHOW PROFILES` and `SHOW PROFILE` statements.

1. Limit the collection of historical events to the user that will run the query. By default, `setup_actors` is configured to allow monitoring and historical event collection for all foreground threads:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
+-----+-----+-----+-----+-----+
```

HOST	USER	ROLE	ENABLED	HISTORY
%	%	%	YES	YES

Update the default row in the `setup_actors` table to disable historical event collection and monitoring for all foreground threads, and insert a new row that enables monitoring and historical event collection for the user that will run the query:

```
mysql> UPDATE performance_schema.setup_actors
      SET ENABLED = 'NO', HISTORY = 'NO'
      WHERE HOST = '%' AND USER = '%';

mysql> INSERT INTO performance_schema.setup_actors
      (HOST,USER,ROLE,ENABLED,HISTORY)
      VALUES ('localhost','test_user','%','YES','YES');
```

Data in the `setup_actors` table should now appear similar to the following:

```
mysql> SELECT * FROM performance_schema.setup_actors;
+-----+-----+-----+-----+-----+
| HOST | USER | ROLE | ENABLED | HISTORY |
+-----+-----+-----+-----+-----+
| %    | %    | %    | NO      | NO      |
| localhost | test_user | %    | YES     | YES     |
+-----+-----+-----+-----+-----+
```

2. Ensure that statement and stage instrumentation is enabled by updating the `setup_instruments` table. Some instruments may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_instruments
      SET ENABLED = 'YES', TIMED = 'YES'
      WHERE NAME LIKE '%statement/%';

mysql> UPDATE performance_schema.setup_instruments
      SET ENABLED = 'YES', TIMED = 'YES'
      WHERE NAME LIKE '%stage/%';
```

3. Ensure that `events_statements_*` and `events_stages_*` consumers are enabled. Some consumers may already be enabled by default.

```
mysql> UPDATE performance_schema.setup_consumers
      SET ENABLED = 'YES'
      WHERE NAME LIKE '%events_statements_%';

mysql> UPDATE performance_schema.setup_consumers
      SET ENABLED = 'YES'
      WHERE NAME LIKE '%events_stages_%';
```

4. Under the user account you are monitoring, run the statement that you want to profile. For example:

```
mysql> SELECT * FROM employees.employees WHERE emp_no = 10001;
+-----+-----+-----+-----+-----+-----+
| emp_no | birth_date | first_name | last_name | gender | hire_date |
+-----+-----+-----+-----+-----+-----+
| 10001 | 1953-09-02 | Georgi | Facello | M | 1986-06-26 |
+-----+-----+-----+-----+-----+-----+
```

5. Identify the `EVENT_ID` of the statement by querying the `events_statements_history_long` table. This step is similar to running `SHOW PROFILES` to identify the `Query_ID`. The following query produces output similar to `SHOW PROFILES`:

```
mysql> SELECT EVENT_ID, TRUNCATE(TIMER_WAIT/1000000000000,6) as Duration, SQL_TEXT
      FROM performance_schema.events_statements_history_long WHERE SQL_TEXT like '%10001%';
```

event_id	duration	sql_text
31	0.028310	SELECT * FROM employees.employees WHERE emp_no = 10001

- Query the `events_stages_history_long` table to retrieve the statement's stage events. Stages are linked to statements using event nesting. Each stage event record has a `NESTING_EVENT_ID` column that contains the `EVENT_ID` of the parent statement.

```
mysql> SELECT event_name AS Stage, TRUNCATE(TIMER_WAIT/1000000000000,6) AS Duration
FROM performance_schema.events_stages_history_long WHERE NESTING_EVENT_ID=31;
```

Stage	Duration
stage/sql/starting	0.000080
stage/sql/checking permissions	0.000005
stage/sql/Opening tables	0.027759
stage/sql/init	0.000052
stage/sql/System lock	0.000009
stage/sql/optimizing	0.000006
stage/sql/statistics	0.000082
stage/sql/preparing	0.000008
stage/sql/executing	0.000000
stage/sql/Sending data	0.000017
stage/sql/end	0.000001
stage/sql/query end	0.000004
stage/sql/closing tables	0.000006
stage/sql/freeing items	0.000272
stage/sql/cleaning up	0.000001

## 25.19 Migrating to Performance Schema System and Status Variable Tables

The `INFORMATION_SCHEMA` has tables that contain system and status variable information (see [Section 24.11](#), “The `INFORMATION_SCHEMA` `GLOBAL_VARIABLES` and `SESSION_VARIABLES` Tables”, and [Section 24.10](#), “The `INFORMATION_SCHEMA` `GLOBAL_STATUS` and `SESSION_STATUS` Tables”). The Performance Schema also contains system and status variable tables (see [Section 25.11.13](#), “Performance Schema System Variable Tables”, and [Section 25.11.14](#), “Performance Schema Status Variable Tables”). The Performance Schema tables are intended to replace the `INFORMATION_SCHEMA` tables, which are deprecated as of MySQL 5.7.6 and will be removed in a future MySQL release.

This section describes the intended migration path away from the `INFORMATION_SCHEMA` system and status variable tables to the corresponding Performance Schema tables. Application developers should use this information as guidance regarding the changes required to access system and status variables in MySQL 5.7.6 and up as the `INFORMATION_SCHEMA` tables become deprecated and eventually are removed.

### MySQL 5.6

In MySQL 5.6, system and status variable information is available from these `SHOW` statements:

```
SHOW VARIABLES
SHOW STATUS
```

And from these `INFORMATION_SCHEMA` tables:

```
INFORMATION_SCHEMA.GLOBAL_VARIABLES
INFORMATION_SCHEMA.SESSION_VARIABLES
INFORMATION_SCHEMA.GLOBAL_STATUS
```

```
INFORMATION_SCHEMA.SESSION_STATUS
```

## MySQL 5.7

As of MySQL 5.7.6, the Performance Schema includes these tables as new sources of system and status variable information:

```
performance_schema.global_variables
performance_schema.session_variables
performance_schema.variables_by_thread

performance_schema.global_status
performance_schema.session_status
performance_schema.status_by_thread
performance_schema.status_by_account
performance_schema.status_by_host
performance_schema.status_by_user
```

MySQL 5.7.6 also adds a `show_compatibility_56` system variable to control how the server makes system and status variable information available.

When `show_compatibility_56` is `ON`, compatibility with MySQL 5.6 is enabled. The older system and status variable sources (`SHOW` statements, `INFORMATION_SCHEMA` tables) are available with semantics identical to MySQL 5.6. Applications should run as is, with no code changes, and should see the same variable names and values as in MySQL 5.6. Warnings occur under these circumstances:

- A deprecation warning is raised when selecting from the `INFORMATION_SCHEMA` tables.
- In MySQL 5.7.6 and 5.7.7, a deprecation warning is raised when using a `WHERE` clause with the `SHOW` statements. This behavior does not occur as of MySQL 5.7.8.

When `show_compatibility_56` is `OFF`, compatibility with MySQL 5.6 is disabled and several changes result. Applications must be revised as follows to run properly:

- Selecting from the `INFORMATION_SCHEMA` tables produces an error. Applications that access the `INFORMATION_SCHEMA` tables should be revised to use the corresponding Performance Schema tables instead.

Before MySQL 5.7.9, selecting from the `INFORMATION_SCHEMA` tables produces an empty result set plus a deprecation warning. This was not sufficient notice to signal the need to migrate to the corresponding Performance Schema system and status variable tables for the case that `show_compatibility_56=OFF`. Producing an error in MySQL 5.7.9 and higher makes it more evident that an application is operating under conditions that require modification, as well as where the problem lies.

In MySQL 5.7.6 and 5.7.7, the Performance Schema `session_variables` and `session_status` tables do not fully reflect all variable values in effect for the current session; they include no rows for global variables that have no session counterpart. This is corrected in MySQL 5.7.8.

- Output for the `SHOW` statements is produced using the underlying Performance Schema tables. Applications written to use these statements can still use them, but it is best to use MySQL 5.7.8 or higher. In MySQL 5.7.6 and 5.7.7, the results may differ:
  - `SHOW [SESSION] VARIABLES` output does not include global variables that have no session counterpart.
  - Using a `WHERE` clause with the `SHOW` statements produces an error.
- These `Slave_xxx` status variables become unavailable through `SHOW STATUS`:

```
Slave_heartbeat_period
Slave_last_heartbeat
```

```
Slave_received_heartbeats  
Slave_retried_transactions  
Slave_running
```

Applications that use these status variables should be revised to obtain this information using the replication-related Performance Schema tables. For details, see [Effect of show\\_compatibility\\_56 on Slave Status Variables](#).

- The Performance Schema does not collect statistics for `Com_xxx` status variables in the status variable tables. To obtain global and per-session statement execution counts, use the `events_statements_summary_global_by_event_name` and `events_statements_summary_by_thread_by_event_name` tables, respectively.

### Migration and Privileges

Initially, with the introduction of Performance Schema system and status variable tables in MySQL 5.7.6, access to those tables required the `SELECT` privilege, just as for other Performance Schema tables. However, this had the consequence that when `show_compatibility_56=OFF`, the `SHOW VARIABLES` and `SHOW STATUS` statements also required the `SELECT` privilege: With compatibility disabled, output for those statements was taken from the Performance Schema `global_variables`, `session_variables`, `global_status`, and `session_status` tables.

As of MySQL 5.7.9, those Performance Schema tables are world readable and accessible without the `SELECT` privilege. Consequently, `SHOW VARIABLES` and `SHOW STATUS` do not require privileges on the underlying Performance Schema tables from which their output is produced when `show_compatibility_56=OFF`.

### Beyond MySQL 5.7

In a MySQL 8.0, the `INFORMATION_SCHEMA` variable tables and the `show_compatibility_56` system variable are removed, and output from the `SHOW` statements is always based on the underlying Performance Schema tables.

Applications that have been revised to work in MySQL 5.7 when `show_compatibility_56=OFF` should work without further changes, except that it will not be possible to test or set `show_compatibility_56` because it will not exist.

---

## Chapter 26 MySQL sys Schema

### Table of Contents

26.1 Prerequisites for Using the sys Schema .....	3927

26.4.3 sys Schema Views .....	3937
26.4.4 sys Schema Stored Procedures .....	3976
26.4.5 sys Schema Stored Functions .....	3995

MySQL 5.7.7 and higher includes the `sys` schema, a set of objects that helps DBAs and developers interpret data collected by the Performance Schema. `sys` schema objects can be used for typical tuning and diagnosis use cases. Objects in this schema include:

- Views that summarize Performance Schema data into more easily understandable form.
- Stored procedures that perform operations such as Performance Schema configuration and generating diagnostic reports.
- Stored functions that query Performance Schema configuration and provide formatting services.

For new installations, the `sys` schema is installed by default during data directory initialization if you use `mysqld` with the `--initialize` or `--initialize-insecure` option. You can drop the `sys` schema manually after initialization if it is unneeded.

For upgrades, `mysql_upgrade` installs the `sys` schema if it is not installed, and upgrades it to the current version otherwise. To permit this behavior to be suppressed, `mysql_upgrade` has a `--skip-sys-schema` option.

`mysql_upgrade` returns an error if a `sys` schema exists but has no `version` view, on the assumption that absence of this view indicates a user-created `sys` schema. To upgrade in this case, remove or rename the existing `sys` schema first.

As of MySQL 5.7.9, `sys` schema objects have a `DEFINER` of `'mysql.sys'@'localhost'`. (Before MySQL 5.7.9, the `DEFINER` is `'root'@'localhost'`.) Use of the dedicated `mysql.sys` account avoids problems that occur if a DBA renames or removes the `root` account.

### 26.1 Prerequisites for Using the sys Schema

Before using the `sys` schema, the prerequisites described in this section must be satisfied.

Because the `sys` schema provides an alternative means of accessing the Performance Schema, the Performance Schema must be enabled for the `sys` schema to work. See [Section 25.3, “Performance Schema Startup Configuration”](#).

For full access to the `sys` schema, a user must have these privileges:

- `SELECT` on all `sys` tables and views
- `EXECUTE` on all `sys` stored procedures and functions
- `INSERT` and `UPDATE` for the `sys_config` table, if changes are to be made to it
- Additional privileges for certain `sys` schema stored procedures and functions, as noted in their descriptions; for example, the `ps_setup_save()` procedure

It is also necessary to have privileges for the objects underlying the `sys` schema objects:

- `SELECT` on any Performance Schema tables accessed by `sys` schema objects, and `UPDATE` for any tables to be updated using `sys` schema objects
- `PROCESS` for the `INFORMATION_SCHEMA INNODB_BUFFER_PAGE` table

Certain Performance Schema instruments and consumers must be enabled and (for instruments) timed to take full advantage of `sys` schema capabilities:

- All `wait` instruments
- All `stage` instruments
- All `statement` instruments
- `xxx_current` and `xxx_history_long` consumers for all events

You can use the `sys` schema itself to enable all of the additional instruments and consumers:

```
CALL sys.ps_setup_enable_instrument('wait');
CALL sys.ps_setup_enable_instrument('stage');
CALL sys.ps_setup_enable_instrument('statement');
CALL sys.ps_setup_enable_consumer('current');
CALL sys.ps_setup_enable_consumer('history_long');
```

#### Note

For many uses of the `sys` schema, the default Performance Schema is sufficient for data collection. Enabling all the instruments and consumers just mentioned has a performance impact, so it is preferable to enable only the additional configuration you need. Also, remember that if you enable additional configuration, you can easily restore the default configuration like this:

```
CALL sys.ps_setup_reset_to_default(TRUE);
```

## 26.2 Using the sys Schema

You can make the `sys` schema the default schema so that references to its objects need not be qualified with the schema name:

```
mysql> USE sys;
Database changed
mysql> SELECT * FROM version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 1.5.1       | 5.7.24-debug-log |
+-----+-----+
```

(The `version` view shows the `sys` schema and MySQL server versions.)

To access `sys` schema objects while a different schema is the default (or simply to be explicit), qualify object references with the schema name:

```
mysql> SELECT * FROM sys.version;
+-----+-----+
| sys_version | mysql_version |
+-----+-----+
| 1.5.1       | 5.7.24-debug-log |
+-----+-----+
```

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other

member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host      | ios    | io_latency |
+-----+-----+-----+
| localhost | 67570  | 5.38 s     |
| background | 3468   | 4.18 s     |
+-----+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host      | ios    | io_latency |
+-----+-----+-----+
| localhost | 67574  | 5380678125144 |
| background | 3474   | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier for humans to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data. For additional information about the differences between non-`x$` and `x$` views, see [Section 26.4.3, “sys Schema Views”](#).

To examine `sys` schema object definitions, use the appropriate `SHOW` statement or `INFORMATION_SCHEMA` query. For example, to examine the definitions of the `session` view and `format_bytes()` function, use these statements:

```
mysql> SHOW CREATE VIEW sys.session;
mysql> SHOW CREATE FUNCTION sys.format_bytes;
```

However, those statements display the definitions in relatively unformatted form. To view object definitions with more readable formatting, access the individual `.sql` files available from the `sys` schema development website at <https://github.com/mysql/mysql-sys>.

Neither `mysqldump` nor `mysqlpump` dump the `sys` schema by default. To generate a dump file, name the `sys` schema explicitly on the command line using either of these commands:

```
mysqldump --databases --routines sys > sys_dump.sql
mysqlpump sys > sys_dump.sql
```

To reinstall the schema from the dump file, use this command:

```
mysql < sys_dump.sql
```

## 26.3 sys Schema Progress Reporting

As of MySQL 5.7.9, the following `sys` schema views provide progress reporting for long-running transactions:

```
processlist
session
x$processlist
x$session
```

Assuming that the required instruments and consumers are enabled, the `progress` column of these views shows the percentage of work completed for stages that support progress reporting.

Stage progress reporting requires that the `events_stages_current` consumer be enabled, as well as the instruments for which progress information is desired. Instruments for these stages currently support progress reporting:

```
stage/sql/Copying to tmp table
stage/innodb/alter table (end)
stage/innodb/alter table (flush)
stage/innodb/alter table (insert)
stage/innodb/alter table (log apply index)
stage/innodb/alter table (log apply table)
stage/innodb/alter table (merge sort)
stage/innodb/alter table (read PK and internal sort)
stage/innodb/buffer pool load
```

For stages that do not support estimated and completed work reporting, or if the required instruments or consumers are not enabled, the `progress` column is `NULL`.

## 26.4 sys Schema Object Reference

The `sys` schema includes tables and triggers, views, and stored procedures and functions. The following sections provide details for each of these objects.

### 26.4.1 sys Schema Object Index

The following tables list `sys` schema objects and provide a short description of each one.

**Table 26.1 sys Schema Tables and Triggers**

Table or Trigger Name	Description
<code>sys_config</code>	<code>sys</code> schema configuration options
<code>sys_config_insert_set_user</code>	<code>sys_config</code> insert trigger
<code>sys_config_update_set_user</code>	<code>sys_config</code> update trigger

**Table 26.2 sys Schema Views**

View Name	Description
<code>host_summary</code> , <code>x\$host_summary</code>	Statement activity, file I/O, and connections, grouped by host
<code>host_summary_by_file_io</code> , <code>x\$host_summary_by_file_io</code>	File I/O, grouped by host
<code>host_summary_by_file_io_type</code> , <code>x\$host_summary_by_file_io_type</code>	File I/O, grouped by host and event type
<code>host_summary_by_stages</code> , <code>x\$host_summary_by_stages</code>	Statement stages, grouped by host
<code>host_summary_by_statement_latency</code> , <code>x\$host_summary_by_statement_latency</code>	Statement statistics, grouped by host
<code>host_summary_by_statement_type</code> , <code>x\$host_summary_by_statement_type</code>	Statements executed, grouped by host and statement
<code>innodb_buffer_stats_by_schema</code> , <code>x\$innodb_buffer_stats_by_schema</code>	InnoDB buffer information, grouped by schema
<code>innodb_buffer_stats_by_table</code> , <code>x\$innodb_buffer_stats_by_table</code>	InnoDB buffer information, grouped by schema and table
<code>innodb_lock_waits</code> , <code>x\$innodb_lock_waits</code>	InnoDB lock information
<code>io_by_thread_by_latency</code> , <code>x\$io_by_thread_by_latency</code>	I/O consumers, grouped by thread

View Name	Description
<a href="#">io_global_by_file_by_bytes</a> , x <a href="#">\$io_global_by_file_by_bytes</a>	Global I/O consumers, grouped by file and bytes
<a href="#">io_global_by_file_by_latency</a> , x <a href="#">\$io_global_by_file_by_latency</a>	Global I/O consumers, grouped by file and latency
<a href="#">io_global_by_wait_by_bytes</a> , x <a href="#">\$io_global_by_wait_by_bytes</a>	Global I/O consumers, grouped by bytes
<a href="#">io_global_by_wait_by_latency</a> , x <a href="#">\$io_global_by_wait_by_latency</a>	Global I/O consumers, grouped by latency
<a href="#">latest_file_io</a> , x <a href="#">\$latest_file_io</a>	Most recent I/O, grouped by file and thread
<a href="#">memory_by_host_by_current_bytes</a> , x <a href="#">\$memory_by_host_by_current_bytes</a>	Memory use, grouped by host
<a href="#">memory_by_thread_by_current_bytes</a> , x <a href="#">\$memory_by_thread_by_current_bytes</a>	Memory use, grouped by thread
<a href="#">memory_by_user_by_current_bytes</a> , x <a href="#">\$memory_by_user_by_current_bytes</a>	Memory use, grouped by user
<a href="#">memory_global_by_current_bytes</a> , x <a href="#">\$memory_global_by_current_bytes</a>	Memory use, grouped by allocation type
<a href="#">memory_global_total</a> , x <a href="#">\$memory_global_total</a>	Total memory use
<a href="#">metrics</a>	Server metrics
<a href="#">processlist</a> , x <a href="#">\$processlist</a>	Processlist information
<a href="#">ps_check_lost_instrumentation</a>	Variables that have lost instruments
<a href="#">schema_auto_increment_columns</a>	<a href="#">AUTO_INCREMENT</a> column information
<a href="#">schema_index_statistics</a> , x <a href="#">\$schema_index_statistics</a>	Index statistics
<a href="#">schema_object_overview</a>	Types of objects within each schema
<a href="#">schema_redundant_indexes</a>	Duplicate or redundant indexes
<a href="#">schema_table_lock_waits</a> , x <a href="#">\$schema_table_lock_waits</a>	Sessions waiting for metadata locks
<a href="#">schema_table_statistics</a> , x <a href="#">\$schema_table_statistics</a>	Table statistics
<a href="#">schema_table_statistics_with_buffer</a> , x <a href="#">\$schema_table_statistics_with_buffer</a>	Table statistics, including <a href="#">InnoDB</a> buffer pool statistics
<a href="#">schema_tables_with_full_table_scans</a> , x <a href="#">\$schema_tables_with_full_table_scans</a>	Tables being accessed with full scans
<a href="#">schema_unused_indexes</a>	Indexes not in active use
<a href="#">session</a> , x <a href="#">\$session</a>	Processlist information for user sessions
<a href="#">session_ssl_status</a>	Connection SSL information
<a href="#">statement_analysis</a> , x <a href="#">\$statement_analysis</a>	Statement aggregate statistics
<a href="#">statements_with_errors_or_warnings</a> , x <a href="#">\$statements_with_errors_or_warnings</a>	Statements that have produced errors or warnings
<a href="#">statements_with_full_table_scans</a> , x <a href="#">\$statements_with_full_table_scans</a>	Statements that have done full table scans
<a href="#">statements_with_runtime_in_95th_percentile</a> , x <a href="#">\$statements_with_runtime_in_95th_percentile</a>	Statements with highest average runtime

View Name	Description
<code>statements_with_sorting, x \$statements_with_sorting</code>	Statements that performed sorts
<code>statements_with_temp_tables, x \$statements_with_temp_tables</code>	Statements that used temporary tables
<code>user_summary, x\$user_summary</code>	User statement and connection activity
<code>user_summary_by_file_io, x \$user_summary_by_file_io</code>	File I/O, grouped by user
<code>user_summary_by_file_io_type, x \$user_summary_by_file_io_type</code>	File I/O, grouped by user and event
<code>user_summary_by_stages, x \$user_summary_by_stages</code>	Stage events, grouped by user
<code>user_summary_by_statement_latency, x \$user_summary_by_statement_latency</code>	Statement statistics, grouped by user
<code>user_summary_by_statement_type, x \$user_summary_by_statement_type</code>	Statements executed, grouped by user and statement
<code>version</code>	Current <a href="#">sys</a> schema and MySQL server versions
<code>wait_classes_global_by_avg_latency, x \$wait_classes_global_by_avg_latency</code>	Wait class average latency, grouped by event class
<code>wait_classes_global_by_latency, x \$wait_classes_global_by_latency</code>	Wait class total latency, grouped by event class
<code>waits_by_host_by_latency, x \$waits_by_host_by_latency</code>	Wait events, grouped by host and event
<code>waits_by_user_by_latency, x \$waits_by_user_by_latency</code>	Wait events, grouped by user and event
<code>waits_global_by_latency, x \$waits_global_by_latency</code>	Wait events, grouped by event
<code>x\$ps_digest_95th_percentile_by_avg_us</code>	Helper view for 95th-percentile views
<code>x\$ps_digest_avg_latency_distribution</code>	Helper view for 95th-percentile views
<code>x\$ps_schema_table_statistics_io</code>	Helper view for table-statistics views
<code>x\$schema_flattened_keys</code>	Helper view for <a href="#">schema_redundant_indexes</a>

Table 26.3 sys Schema Stored Procedures

Procedure Name	Description
<code>create_synonym_db( )</code>	Create synonym for schema
<code>diagnostics( )</code>	Collect system diagnostic information
<code>execute_prepared_stmt( )</code>	Execute prepared statement
<code>ps_setup_disable_background_threads( )</code>	Disable background thread instrumentation
<code>ps_setup_disable_consumer( )</code>	Disable consumers
<code>ps_setup_disable_instrument( )</code>	Disable instruments
<code>ps_setup_disable_thread( )</code>	Disable instrumentation for thread
<code>ps_setup_enable_background_threads( )</code>	Enable background thread instrumentation
<code>ps_setup_enable_consumer( )</code>	Enable consumers

Procedure Name	Description
<code>ps_setup_enable_instrument()</code>	Enable instruments
<code>ps_setup_enable_thread()</code>	Enable instrumentation for thread
<code>ps_setup_reload_saved()</code>	Reload saved Performance Schema configuration
<code>ps_setup_reset_to_default()</code>	Reset saved Performance Schema configuration
<code>ps_setup_save()</code>	Save Performance Schema configuration
<code>ps_setup_show_disabled()</code>	Display disabled Performance Schema configuration
<code>ps_setup_show_disabled_consumers()</code>	Display disabled Performance Schema consumers
<code>ps_setup_show_disabled_instruments()</code>	Display disabled Performance Schema instruments
<code>ps_setup_show_enabled()</code>	Display enabled Performance Schema configuration
<code>ps_setup_show_enabled_consumers()</code>	Display enabled Performance Schema consumers
<code>ps_setup_show_enabled_instruments()</code>	Display enabled Performance Schema instruments
<code>ps_statement_avg_latency_histogram()</code>	Display statement latency histogram
<code>ps_trace_statement_digest()</code>	Trace Performance Schema instrumentation for digest
<code>ps_trace_thread()</code>	Dump Performance Schema data for thread
<code>ps_truncate_all_tables()</code>	Truncate Performance Schema summary tables
<code>statement_performance_analyzer()</code>	Report of statements running on server
<code>table_exists()</code>	Whether a table exists

**Table 26.4 sys Schema Stored Functions**

Function Name	Description
<code>extract_schema_from_file_name()</code>	Extract schema name from file path name
<code>extract_table_from_file_name()</code>	Extract table name from file path name
<code>format_bytes()</code>	Convert byte value to value with units
<code>format_path()</code>	Replace data and temp-file directories in path name with symbolic values
<code>format_statement()</code>	Truncate long statement to fixed length
<code>format_time()</code>	Convert picoseconds value to value with units
<code>list_add()</code>	Add item to list
<code>list_drop()</code>	Remove item from list
<code>ps_is_account_enabled()</code>	Check whether account instrumentation is enabled
<code>ps_is_consumer_enabled()</code>	Check whether consumer is enabled

Function Name	Description
<code>ps_is_instrument_default_enabled()</code>	Check whether instrument is enabled
<code>ps_is_instrument_default_timed()</code>	Check whether instrument is timed
<code>ps_is_thread_instrumented()</code>	Check whether thread is instrumented
<code>ps_thread_account()</code>	Return account for thread ID
<code>ps_thread_id()</code>	Return thread ID for connection ID
<code>ps_thread_stack()</code>	Return event information for thread ID
<code>ps_thread_trx_info()</code>	Return transaction information for thread ID
<code>quote_identifier()</code>	Return string as quoted identifier
<code>sys_get_config()</code>	Return <code>sys</code> schema configuration option
<code>version_major()</code>	MySQL server major version number
<code>version_minor()</code>	MySQL server minor version number
<code>version_patch()</code>	MySQL server patch release version number

## 26.4.2 sys Schema Tables and Triggers

The following sections describe `sys` schema tables and triggers.

### 26.4.2.1 The `sys_config` Table

This table contains `sys` schema configuration options, one row per option. Configuration changes made by updating this table persist across client sessions and server restarts.

The `sys_config` table has these columns:

- `variable`

The configuration option name.

- `value`

The configuration option value.

- `set_time`

The timestamp of the most recent modification to the row.

- `set_by`

The account that made the most recent modification to the row. The value is `NULL` if the row has not been changed since the `sys` schema was installed.

As an efficiency measure to minimize the number of direct reads from the `sys_config` table, `sys` schema functions that use a value from this table check for a user-defined variable with a corresponding name, which is the user-defined variable having the same name plus a `@sys.` prefix. (For example, the variable corresponding to the `diagnostics.include_raw` option is `@sys.diagnostics.include_raw`.) If the user-defined variable exists in the current session and is non-`NULL`, the function uses its value in preference to the value in the `sys_config` table. Otherwise, the function reads and uses the value from the table. In the latter case, the calling function conventionally also sets the corresponding user-defined variable to the table value so that further references to the configuration option within the same session use the variable and need not read the table again.

For example, the `statement_truncate_len` option controls the maximum length of statements returned by the `format_statement()` function. The default is 64. To temporarily change the value to 32 for your current session, set the corresponding `@sys.statement_truncate_len` user-defined variable:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+
```

Subsequent invocations of `format_statement()` within the session continue to use the user-defined variable value (32), rather than the value stored in the table (64).

To stop using the user-defined variable and revert to using the value in the table, set the variable to `NULL` within your session:

```
mysql> SET @sys.statement_truncate_len = NULL;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
```

Alternatively, end your current session (causing the user-defined variable to no longer exist) and begin a new session.

The conventional relationship just described between options in the `sys_config` table and user-defined variables can be exploited to make temporary configuration changes that end when your session ends. However, if you set a user-defined variable and then subsequently change the corresponding table value within the same session, the changed table value will not be used in that session as long as the user-defined variable exists with a non-`NULL` value. (The changed table value *will* be used in other sessions that do not have the user-defined variable assigned.)

The following list describes the options in the `sys_config` table and the corresponding user-defined variables:

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

This option was added in MySQL 5.7.9.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure includes the raw output from querying the `metrics` view. The default is `OFF`.

This option was added in MySQL 5.7.9.

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length for JSON output produced by the `ps_thread_trx_info()` function. The default is 65535.

This option was added in MySQL 5.7.9.

- `statement_performance_analyzer.limit,`  
`@sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. (For example, the `statements_with_runtimes_in_95th_percentile` view has a built-in limit in the sense that it returns only statements with average execution time in the 95th percentile.) The default is 100.

This option was added in MySQL 5.7.9.

- `statement_performance_analyzer.view,`  
`@sys.statement_performance_analyzer.view`

The custom query or view to be used by the `statement_performance_analyzer()` procedure (which is itself invoked by the `diagnostics()` procedure). If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema `events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. The default is `NULL` (no custom view defined).

This option was added in MySQL 5.7.9.

- `statement_truncate_len, @sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

Other options can be added to the `sys_config` table. For example, the `diagnostics()` and `execute_prepared_stmt()` procedures use the `debug` option if it exists, but this option is not part of the `sys_config` table by default because debug output normally is enabled only temporarily, by setting the corresponding `@sys.debug` user-defined variable. To enable debug output without having to set that variable in individual sessions, add the option to the table:

```
mysql> INSERT INTO sys.sys_config (variable, value) VALUES('debug', 'ON');
```

To change the debug setting in the table, do two things. First, modify the value in the table itself:

```
mysql> UPDATE sys.sys_config
      SET value = 'OFF'
      WHERE variable = 'debug';
```

Second, to also ensure that procedure invocations within the current session use the changed value from the table, set the corresponding user-defined variable to `NULL`:

```
mysql> SET @sys.debug = NULL;
```

### 26.4.2.2 The sys\_config\_insert\_set\_user Trigger

For rows added to the `sys_config` table by `INSERT` statements, the `sys_config_insert_set_user` trigger sets the `set_by` column to the current user.

### 26.4.2.3 The sys\_config\_update\_set\_user Trigger

The `sys_config_update_set_user` trigger for the `sys_config` table is similar to the `sys_config_insert_set_user` trigger, but for `UPDATE` statements.

## 26.4.3 sys Schema Views

The following sections describe `sys` schema views.

The `sys` schema contains many views that summarize Performance Schema tables in various ways. Most of these views come in pairs, such that one member of the pair has the same name as the other member, plus a `x$` prefix. For example, the `host_summary_by_file_io` view summarizes file I/O grouped by host and displays latencies converted from picoseconds to more readable values (with units);

```
mysql> SELECT * FROM sys.host_summary_by_file_io;
+-----+-----+-----+
| host      | ios    | io_latency |
+-----+-----+-----+
| localhost | 67570  | 5.38 s     |
| background | 3468   | 4.18 s     |
+-----+-----+-----+
```

The `x$host_summary_by_file_io` view summarizes the same data but displays unformatted picosecond latencies:

```
mysql> SELECT * FROM sys.x$host_summary_by_file_io;
+-----+-----+-----+
| host      | ios    | io_latency |
+-----+-----+-----+
| localhost | 67574  | 5380678125144 |
| background | 3474   | 4758696829416 |
+-----+-----+-----+
```

The view without the `x$` prefix is intended to provide output that is more user friendly and easier to read. The view with the `x$` prefix that displays the same values in raw form is intended more for use with other tools that perform their own processing on the data.

Views without the `x$` prefix differ from the corresponding `x$` views in these ways:

- Byte values are formatted with size units using `format_bytes()`.
- Time values are formatted with temporal units using `format_time()`.
- SQL statements are truncated to a maximum display width using `format_statement()`.
- Path names are shortened using `format_path()`.

### 26.4.3.1 The `host_summary` and `x$host_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by host.

The `host_summary` and `x$host_summary` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the host.

- `statement_latency`

The total wait time of timed statements for the host.

- `statement_avg_latency`

The average wait time per timed statement for the host.

- `table_scans`

The total number of table scans for the host.

- `file_ios`

The total number of file I/O events for the host.

- `file_io_latency`

The total wait time of timed file I/O events for the host.

- `current_connections`

The current number of connections for the host.

- `total_connections`

The total number of connections for the host.

- `unique_users`

The number of distinct users for the host.

- `current_memory`

The current amount of allocated memory for the host.

- `total_memory_allocated`

The total amount of allocated memory for the host.

### 26.4.3.2 The `host_summary_by_file_io` and `x$host_summary_by_file_io` Views

These views summarize file I/O, grouped by host. By default, rows are sorted by descending total file I/O latency.

The `host_summary_by_file_io` and `x$host_summary_by_file_io` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the host.

- `io_latency`

The total wait time of timed file I/O events for the host.

### 26.4.3.3 The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` Views

These views summarize file I/O, grouped by host and event type. By default, rows are sorted by host and descending total I/O latency.

The `host_summary_by_file_io_type` and `x$host_summary_by_file_io_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the host.

- `total_latency`

The total wait time of timed occurrences of the file I/O event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the host.

#### 26.4.3.4 The `host_summary_by_stages` and `x$host_summary_by_stages` Views

These views summarize statement stages, grouped by host. By default, rows are sorted by host and descending total latency.

The `host_summary_by_stages` and `x$host_summary_by_stages` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the host.

- `total_latency`

The total wait time of timed occurrences of the stage event for the host.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the host.

#### 26.4.3.5 The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by host. By default, rows are sorted by descending total latency.

The `host_summary_by_statement_latency` and `x$host_summary_by_statement_latency` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the host.

- `total_latency`

The total wait time of timed statements for the host.

- `max_latency`

The maximum single wait time of timed statements for the host.

- `lock_latency`

The total time waiting for locks by timed statements for the host.

- `rows_sent`

The total number of rows returned by statements for the host.

- `rows_examined`

The total number of rows read from storage engines by statements for the host.

- `rows_affected`

The total number of rows affected by statements for the host.

- `full_scans`

The total number of full table scans by statements for the host.

### 26.4.3.6 The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by host and statement type. By default, rows are sorted by host and descending total latency.

The `host_summary_by_statement_type` and `x$host_summary_by_statement_type` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the host.

- `total_latency`

The total wait time of timed occurrences of the statement event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the host.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the host.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the host.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the host.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the host.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the host.

### 26.4.3.7 The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` Views

These views summarize the information in the `INFORMATION_SCHEMA.INNODB_BUFFER_PAGE` table, grouped by schema. By default, rows are sorted by descending buffer size.

#### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_schema` and `x$innodb_buffer_stats_by_schema` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `allocated`

The total number of bytes allocated for the schema.

- `data`

The total number of data bytes allocated for the schema.

- `pages`

The total number of pages allocated for the schema.

- `pages_hashed`

The total number of hashed pages allocated for the schema.

- `pages_old`

The total number of old pages allocated for the schema.

- `rows_cached`

The total number of cached rows for the schema.

### 26.4.3.8 The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` Views

These views summarize the information in the `INFORMATION_SCHEMA.INNODB_BUFFER_PAGE` table, grouped by schema and table. By default, rows are sorted by descending buffer size.

#### Warning

Querying views that access the `INNODB_BUFFER_PAGE` table can affect performance. Do not query these views on a production system unless you are aware of the performance impact and have determined it to be acceptable. To avoid impacting performance on a production system, reproduce the issue you want to investigate and query buffer pool statistics on a test instance.

The `innodb_buffer_stats_by_table` and `x$innodb_buffer_stats_by_table` views have these columns:

- `object_schema`

The schema name for the object, or `InnoDB System` if the table belongs to the `InnoDB` storage engine.

- `object_name`

The table name.

- `allocated`

The total number of bytes allocated for the table.

- `data`

The number of data bytes allocated for the table.

- `pages`

The total number of pages allocated for the table.

- `pages_hashed`

The number of hashed pages allocated for the table.

- `pages_old`

The number of old pages allocated for the table.

- `rows_cached`

The number of cached rows for the table.

### 26.4.3.9 The `innodb_lock_waits` and `x$innodb_lock_waits` Views

These views summarize the `InnoDB` locks that transactions are waiting for. By default, rows are sorted by descending lock age.

The `innodb_lock_waits` and `x$innodb_lock_waits` views have these columns:

- `wait_started`  
The time at which the lock wait started.
- `wait_age`  
How long the lock has been waited for, as a `TIME` value.
- `wait_age_secs`  
How long the lock has been waited for, in seconds.  
This column was added in MySQL 5.7.9.
- `locked_table`  
The name of the locked table. This column contains combined schema/table name values.
- `locked_index`  
The name of the locked index.
- `locked_type`  
The type of the waiting lock.
- `waiting_trx_id`  
The ID of the waiting transaction.
- `waiting_trx_started`  
The time at which the waiting transaction started.
- `waiting_trx_age`  
How long the waiting transaction has been waiting, as a `TIME` value.
- `waiting_trx_rows_locked`  
The number of rows locked by the waiting transaction.
- `waiting_trx_rows_modified`  
The number of rows modified by the waiting transaction.
- `waiting_pid`  
The processlist ID of the waiting transaction.
- `waiting_query`  
The statement that is waiting for the lock.
- `waiting_lock_id`  
The ID of the waiting lock.
- `waiting_lock_mode`  
The mode of the waiting lock.
- `blocking_trx_id`

The ID of the transaction that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the blocking transaction.

- `blocking_query`

The statement the blocking transaction is executing. This field reports NULL if the session that issued the blocking query becomes idle. For more information, see [Identifying a Blocking Query After the Issuing Session Becomes Idle](#).

- `blocking_lock_id`

The ID of the lock that is blocking the waiting lock.

- `blocking_lock_mode`

The mode of the lock that is blocking the waiting lock.

- `blocking_trx_started`

The time at which the blocking transaction started.

- `blocking_trx_age`

How long the blocking transaction has been executing, as a `TIME` value.

- `blocking_trx_rows_locked`

The number of rows locked by the blocking transaction.

- `blocking_trx_rows_modified`

The number of rows modified by the blocking transaction.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

This column was added in MySQL 5.7.9.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

This column was added in MySQL 5.7.9.

#### 26.4.3.10 The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` Views

These views summarize I/O consumers to display time waiting for I/O, grouped by thread. By default, rows are sorted by descending total I/O latency.

The `io_by_thread_by_latency` and `x$io_by_thread_by_latency` views have these columns:

- `user`

For foreground threads, the account associated with the thread. For background threads, the thread name.

- `total`

The total number of I/O events for the thread.

- `total_latency`

The total wait time of timed I/O events for the thread.

- `min_latency`

The minimum single wait time of timed I/O events for the thread.

- `avg_latency`

The average wait time per timed I/O event for the thread.

- `max_latency`

The maximum single wait time of timed I/O events for the thread.

- `thread_id`

The thread ID.

- `processlist_id`

For foreground threads, the processlist ID of the thread. For background threads, `NULL`.

#### 26.4.3.11 The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O, grouped by file. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_file_by_bytes` and `x$io_global_by_file_by_bytes` views have these columns:

- `file`

The file path name.

- `count_read`

The total number of read events for the file.

- `total_read`

The total number of bytes read from the file.

- `avg_read`

The average number of bytes per read from the file.

- `count_write`

The total number of write events for the file.

- `total_written`

The total number of bytes written to the file.

- `avg_write`

The average number of bytes per write to the file.

- `total`

The total number of bytes read and written for the file.

- `write_pct`

The percentage of total bytes of I/O that were writes.

#### 26.4.3.12 The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` Views

These views summarize global I/O consumers to display time waiting for I/O, grouped by file. By default, rows are sorted by descending total latency.

The `io_global_by_file_by_latency` and `x$io_global_by_file_by_latency` views have these columns:

- `file`

The file path name.

- `total`

The total number of I/O events for the file.

- `total_latency`

The total wait time of timed I/O events for the file.

- `count_read`

The total number of read I/O events for the file.

- `read_latency`

The total wait time of timed read I/O events for the file.

- `count_write`

The total number of write I/O events for the file.

- `write_latency`

The total wait time of timed write I/O events for the file.

- `count_misc`

The total number of other I/O events for the file.

- `misc_latency`

The total wait time of timed other I/O events for the file.

#### 26.4.3.13 The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total I/O (bytes read and written).

The `io_global_by_wait_by_bytes` and `x$io_global_by_wait_by_bytes` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `min_latency`

The minimum single wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

- `total_requested`

The total number of bytes read and written for the I/O event.

#### 26.4.3.14 The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` Views

These views summarize global I/O consumers to display amount of I/O and time waiting for I/O, grouped by event. By default, rows are sorted by descending total latency.

The `io_global_by_wait_by_latency` and `x$io_global_by_wait_by_latency` views have these columns:

- `event_name`

The I/O event name, with the `wait/io/file/` prefix stripped.

- `total`

The total number of occurrences of the I/O event.

- `total_latency`

The total wait time of timed occurrences of the I/O event.

- `avg_latency`

The average wait time per timed occurrence of the I/O event.

- `max_latency`

The maximum single wait time of timed occurrences of the I/O event.

- `read_latency`

The total wait time of timed read occurrences of the I/O event.

- `write_latency`

The total wait time of timed write occurrences of the I/O event.

- `misc_latency`

The total wait time of timed other occurrences of the I/O event.

- `count_read`

The number of read requests for the I/O event.

- `total_read`

The number of bytes read for the I/O event.

- `avg_read`

The average number of bytes per read for the I/O event.

- `count_write`

The number of write requests for the I/O event.

- `total_written`

The number of bytes written for the I/O event.

- `avg_written`

The average number of bytes per write for the I/O event.

### 26.4.3.15 The `latest_file_io` and `x$latest_file_io` Views

These views summarize file I/O activity, grouped by file and thread. By default, rows are sorted with most recent I/O first.

The `latest_file_io` and `x$latest_file_io` views have these columns:

- `thread`

For foreground threads, the account associated with the thread (and port number for TCP/IP connections). For background threads, the thread name and thread ID

- `file`

The file path name.

- `latency`

The wait time of the file I/O event.

- `operation`

The type of operation.

- `requested`

The number of data bytes requested for the file I/O event.

#### 26.4.3.16 The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` Views

These views summarize memory use, grouped by host. By default, rows are sorted by descending amount of memory used.

The `memory_by_host_by_current_bytes` and `x$memory_by_host_by_current_bytes` views have these columns:

- `host`

The host from which the client connected. Rows for which the `HOST` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the host.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the host.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the host.

- `current_max_alloc`

The largest single current memory allocation in bytes for the host.

- `total_allocated`

The total memory allocation in bytes for the host.

#### 26.4.3.17 The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` Views

These views summarize memory use, grouped by thread. By default, rows are sorted by descending amount of memory used.

The `memory_by_thread_by_current_bytes` and `x$memory_by_thread_by_current_bytes` views have these columns:

- `thread_id`

The thread ID.

- `user`

The thread user or thread name.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the thread.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the thread.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the thread.

- `current_max_alloc`

The largest single current memory allocation in bytes for the thread.

- `total_allocated`

The total memory allocation in bytes for the thread.

#### 26.4.3.18 The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` Views

These views summarize memory use, grouped by user. By default, rows are sorted by descending amount of memory used.

The `memory_by_user_by_current_bytes` and `x$memory_by_user_by_current_bytes` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `current_count_used`

The current number of allocated memory blocks that have not been freed yet for the user.

- `current_allocated`

The current number of allocated bytes that have not been freed yet for the user.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the user.

- `current_max_alloc`

The largest single current memory allocation in bytes for the user.

- `total_allocated`

The total memory allocation in bytes for the user.

#### 26.4.3.19 The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` Views

These views summarize memory use, grouped by allocation type (that is, by event). By default, rows are sorted by descending amount of memory used.

The `memory_global_by_current_bytes` and `x$memory_global_by_current_bytes` views have these columns:

- `event_name`

The memory event name.

- `current_count`

The total number of occurrences of the event.

- `current_alloc`

The current number of allocated bytes that have not been freed yet for the event.

- `current_avg_alloc`

The current number of allocated bytes per memory block for the event.

- `high_count`

The high-water mark for number of memory blocks allocated for the event.

- `high_alloc`

The high-water mark for number of bytes allocated for the event.

- `high_avg_alloc`

The high-water mark for average number of bytes per memory block allocated for the event.

#### 26.4.3.20 The `memory_global_total` and `x$memory_global_total` Views

These views summarize total memory use within the server.

The `memory_global_total` and `x$memory_global_total` views have these columns:

- `total_allocated`

The total bytes of memory allocated within the server.

#### 26.4.3.21 The `metrics` View

This view summarizes MySQL server metrics to show variable names, values, types, and whether they are enabled. By default, rows are sorted by variable type and name.

This view was added in MySQL 5.7.9.

The `metrics` view includes this information:

- Global status variables from the Performance Schema `global_status` table
- InnoDB metrics from the `INFORMATION_SCHEMA INNODB_METRICS` table
- Current and total memory allocation, based on the Performance Schema memory instrumentation
- The current time (human readable and Unix timestamp formats)

There is some duplication of information between the `global_status` and `INNODB_METRICS` tables, which the `metrics` view eliminates.

The `metrics` view has these columns:

- `Variable_name`

The metric name. The metric type determines the source from which the name is taken:

- For global status variables: The `VARIABLE_NAME` column of the `global_status` table
- For InnoDB metrics: The `NAME` column of the `INNODB_METRICS` table
- For other metrics: A view-provided descriptive string

- `Variable_value`

The metric value. The metric type determines the source from which the value is taken:

- For global status variables: The `VARIABLE_VALUE` column of the `global_status` table
- For InnoDB metrics: The `COUNT` column of the `INNODB_METRICS` table
- For memory metrics: The relevant column from the Performance Schema `memory_summary_global_by_event_name` table
- For the current time: The value of `NOW(3)` or `UNIX_TIMESTAMP(NOW(3))`

- `Type`

The metric type:

- For global status variables: `Global Status`
- For InnoDB metrics: `InnoDB Metrics - %`, where `%` is replaced by the value of the `SUBSYSTEM` column of the `INNODB_METRICS` table
- For memory metrics: `Performance Schema`
- For the current time: `System Time`

- `Enabled`

Whether the metric is enabled:

- For global status variables: `YES`
- For InnoDB metrics: `YES` if the `STATUS` column of the `INNODB_METRICS` table is `enabled`, `NO` otherwise
- For memory metrics: `NO`, `YES`, or `PARTIAL` (currently, `PARTIAL` occurs only for memory metrics and indicates that not all `memory/%` instruments are enabled; Performance Schema memory instruments are always enabled)
- For the current time: `YES`

### 26.4.3.22 The processlist and x\$processlist Views

These views summarize processlist information. They provide more complete information than the `SHOW PROCESSLIST` statement and the `INFORMATION_SCHEMA.PROCESSLIST` table, and are also nonblocking. By default, rows are sorted by descending process time and descending wait time.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `threads` table at [Section 25.11.16.3, “The threads Table”](#).

The `processlist` and `x$processlist` views have these columns:

- `thd_id`

The thread ID.

- `conn_id`

The connection ID.

- `user`

The thread user or thread name.

- `db`

The default database for the thread, or `NULL` if there is none.

- `command`

For foreground threads, the type of command the thread is executing on behalf of the client, or `Sleep` if the session is idle.

- `state`

An action, event, or state that indicates what the thread is doing.

- `time`

The time in seconds that the thread has been in its current state.

- `current_statement`

The statement the thread is executing, or `NULL` if it is not executing any statement.

- `statement_latency`

How long the statement has been executing.

This column was added in MySQL 5.7.9.

- `progress`

The percentage of work completed for stages that support progress reporting. See [Section 26.3, “sys Schema Progress Reporting”](#).

This column was added in MySQL 5.7.9.

- `lock_latency`

The time spent waiting for locks by the current statement.

- `rows_examined`

The number of rows read from storage engines by the current statement.

- `rows_sent`

The number of rows returned by the current statement.

- `rows_affected`

The number of rows affected by the current statement.

- `tmp_tables`

The number of internal in-memory temporary tables created by the current statement.

- `tmp_disk_tables`

The number of internal on-disk temporary tables created by the current statement.

- `full_scan`

The number of full table scans performed by the current statement.

- `last_statement`

The last statement executed by the thread, if there is no currently executing statement or wait.

- `last_statement_latency`  
How long the last statement executed.
- `current_memory`  
The number of bytes allocated by the thread.
- `last_wait`  
The name of the most recent wait event for the thread.
- `last_wait_latency`  
The wait time of the most recent wait event for the thread.
- `source`  
The source file and line number containing the instrumented code that produced the event.
- `trx_latency`  
The wait time of the current transaction for the thread.  
This column was added in MySQL 5.7.9.
- `trx_state`  
The state for the current transaction for the thread.  
This column was added in MySQL 5.7.9.
- `trx_autocommit`  
Whether autocommit mode was enabled when the current transaction started.  
This column was added in MySQL 5.7.9.
- `pid`  
The client process ID.  
This column was added in MySQL 5.7.9.
- `program_name`  
The client program name.  
This column was added in MySQL 5.7.9.

#### 26.4.3.23 The `ps_check_lost_instrumentation` View

This view returns information about lost Performance Schema instruments, to indicate whether the Performance Schema is unable to monitor all runtime data.

The `ps_check_lost_instrumentation` view has these columns:

- `variable_name`  
The Performance Schema status variable name indicating which type of instrument was lost.
- `variable_value`  
The number of instruments lost.

#### 26.4.3.24 The `schema_auto_increment_columns` View

This view indicates which tables have `AUTO_INCREMENT` columns and provides information about those columns, such as the current and maximum column values and the usage ratio (ratio of used to possible values). By default, rows are sorted by descending usage ratio and maximum column value.

Tables in these schemas are excluded from view output: `mysql`, `sys`, `INFORMATION_SCHEMA`, `performance_schema`.

This view was added in MySQL 5.7.9.

The `schema_auto_increment_columns` view has these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the `AUTO_INCREMENT` column.

- `column_name`

The name of the `AUTO_INCREMENT` column.

- `data_type`

The data type of the column.

- `column_type`

The column type of the column, which is the data type plus possibly other information. For example, for a column with a `bigint(20) unsigned` column type, the data type is just `bigint`.

- `is_signed`

Whether the column type is signed.

- `is_unsigned`

Whether the column type is unsigned.

- `max_value`

The maximum permitted value for the column.

- `auto_increment`

The current `AUTO_INCREMENT` value for the column.

- `auto_increment_ratio`

The ratio of used to permitted values for the column. This indicates how much of the sequence of values is “used up.”

#### 26.4.3.25 The `schema_index_statistics` and `x$schema_index_statistics` Views

These views provide index statistics. By default, rows are sorted by descending total index latency.

The `schema_index_statistics` and `x$schema_index_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table that contains the index.

- `index_name`

The name of the index.

- `rows_selected`

The total number of rows read using the index.

- `select_latency`

The total wait time of timed reads using the index.

- `rows_inserted`

The total number of rows inserted into the index.

- `insert_latency`

The total wait time of timed inserts into the index.

- `rows_updated`

The total number of rows updated in the index.

- `update_latency`

The total wait time of timed updates in the index.

- `rows_deleted`

The total number of rows deleted from the index.

- `delete_latency`

The total wait time of timed deletes from the index.

### 26.4.3.26 The `schema_object_overview` View

This view summarizes the types of objects within each schema. By default, rows are sorted by schema and object type.

**Note**

For MySQL instances with a large number of objects, this view might take a long time to execute.

The `schema_object_overview` view has these columns:

- `db`

The schema name.

- `object_type`

The object type: `BASE TABLE`, `INDEX (index_type)`, `EVENT`, `FUNCTION`, `PROCEDURE`, `TRIGGER`, `VIEW`.

- `count`

The number of objects in the schema of the given type.

### 26.4.3.27 The `schema_redundant_indexes` and `x$schema_flattened_keys` Views

The `schema_redundant_indexes` view displays indexes that duplicate other indexes or are made redundant by them. The `x$schema_flattened_keys` view is a helper view for `schema_redundant_indexes`.

These views were added in MySQL 5.7.9.

In the following column descriptions, the dominant index is the one that makes the redundant index redundant.

The `schema_redundant_indexes` view has these columns:

- `table_schema`  
The schema that contains the table.
- `table_name`  
The table that contains the index.
- `redundant_index_name`  
The name of the redundant index.
- `redundant_index_columns`  
The names of the columns in the redundant index.
- `redundant_index_non_unique`  
The number of nonunique columns in the redundant index.
- `dominant_index_name`  
The name of the dominant index.
- `dominant_index_columns`  
The names of the columns in the dominant index.
- `dominant_index_non_unique`  
The number of nonunique columns in the dominant index.
- `subpart_exists`  
Whether the index indexes only part of a column.
- `sql_drop_index`  
The statement to execute to drop the redundant index.

The `x$schema_flattened_keys` view has these columns:

- `table_schema`  
The schema that contains the table.
- `table_name`  
The table that contains the index.
- `index_name`

An index name.

- `non_unique`

The number of nonunique columns in the index.

- `subpart_exists`

Whether the index indexes only part of a column.

- `index_columns`

The name of the columns in the index.

### 26.4.3.28 The `schema_table_lock_waits` and `x$schema_table_lock_waits` Views

These views display which sessions are blocked waiting on metadata locks, and what is blocking them.

These views were added in MySQL 5.7.9.

The column descriptions here are brief. For additional information, see the description of the Performance Schema `metadata_locks` table at [Section 25.11.12.1, “The metadata\\_locks Table”](#).

The `schema_table_lock_waits` and `x$schema_table_lock_waits` views have these columns:

- `object_schema`

The schema containing the object to be locked.

- `object_name`

The name of the instrumented object.

- `waiting_thread_id`

The thread ID of the thread that is waiting for the lock.

- `waiting_pid`

The processlist ID of the thread that is waiting for the lock.

- `waiting_account`

The account associated with the session that is waiting for the lock.

- `waiting_lock_type`

The type of the waiting lock.

- `waiting_lock_duration`

How long the waiting lock has been waiting.

- `waiting_query`

The statement that is waiting for the lock.

- `waiting_query_secs`

How long the statement has been waiting, in seconds.

- `waiting_query_rows_affected`

The number of rows affected by the statement.

- `waiting_query_rows_examined`

The number of rows read from storage engines by the statement.

- `blocking_thread_id`

The thread ID of the thread that is blocking the waiting lock.

- `blocking_pid`

The processlist ID of the thread that is blocking the waiting lock.

- `blocking_account`

The account associated with the thread that is blocking the waiting lock.

- `blocking_lock_type`

The type of lock that is blocking the waiting lock.

- `blocking_lock_duration`

How long the blocking lock has been held.

- `sql_kill_blocking_query`

The `KILL` statement to execute to kill the blocking statement.

- `sql_kill_blocking_connection`

The `KILL` statement to execute to kill the session running the blocking statement.

### 26.4.3.29 The `schema_table_statistics` and `x$schema_table_statistics` Views

These views summarize table statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views user a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics` and `x$schema_table_statistics` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `total_latency`

The total wait time of timed I/O events for the table.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

### 26.4.3.30 The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` Views

These views summarize table statistics, including InnoDB buffer pool statistics. By default, rows are sorted by descending total wait time (tables with most contention first).

These views use a helper view, `x$ps_schema_table_statistics_io`.

The `schema_table_statistics_with_buffer` and `x$schema_table_statistics_with_buffer` views have these columns:

- `table_schema`

The schema that contains the table.

- `table_name`

The table name.

- `rows_fetched`

The total number of rows read from the table.

- `fetch_latency`

The total wait time of timed read I/O events for the table.

- `rows_inserted`

The total number of rows inserted into the table.

- `insert_latency`

The total wait time of timed insert I/O events for the table.

- `rows_updated`

The total number of rows updated in the table.

- `update_latency`

The total wait time of timed update I/O events for the table.

- `rows_deleted`

The total number of rows deleted from the table.

- `delete_latency`

The total wait time of timed delete I/O events for the table.

- `io_read_requests`

The total number of read requests for the table.

- `io_read`

The total number of bytes read from the table.

- `io_read_latency`

The total wait time of reads from the table.

- `io_write_requests`

The total number of write requests for the table.

- `io_write`

The total number of bytes written to the table.

- `io_write_latency`

The total wait time of writes to the table.

- `io_misc_requests`

The total number of miscellaneous I/O requests for the table.

- `io_misc_latency`

The total wait time of miscellaneous I/O requests for the table.

- `innodb_buffer_allocated`

The total number of InnoDB buffer bytes allocated for the table.

- `innodb_buffer_data`

The total number of InnoDB data bytes allocated for the table.

- `innodb_buffer_free`

The total number of InnoDB nondata bytes allocated for the table (`innodb_buffer_allocated - innodb_buffer_data`).

- `innodb_buffer_pages`

The total number of InnoDB pages allocated for the table.

- `innodb_buffer_pages_hashed`

The total number of InnoDB hashed pages allocated for the table.

- `innodb_buffer_pages_old`

The total number of InnoDB old pages allocated for the table.

- `innodb_buffer_rows_cached`

The total number of InnoDB cached rows for the table.

### 26.4.3.31 The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` Views

These views display which tables are being accessed with full table scans. By default, rows are sorted by descending rows scanned.

The `schema_tables_with_full_table_scans` and `x$schema_tables_with_full_table_scans` views have these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `rows_full_scanned`

The total number of rows scanned by full scans of the table.

- `latency`

The total wait time of full scans of the table.

### 26.4.3.32 The `schema_unused_indexes` View

These views display indexes for which there are no events, which indicates that they are not being used. By default, rows are sorted by schema and table.

This view is most useful when the server has been up and processing long enough that its workload is representative. Otherwise, presence of an index in this view may not be meaningful.

The `schema_unused_indexes` view has these columns:

- `object_schema`

The schema name.

- `object_name`

The table name.

- `index_name`

The unused index name.

### 26.4.3.33 The `session` and `x$session` Views

These views are similar to `processlist` and `x$processlist`, but they filter out background processes to display only user sessions. For descriptions of the columns, see [Section 26.4.3.22, “The `processlist` and `x\$processlist` Views”](#).

These views were added in MySQL 5.7.9.

### 26.4.3.34 The `session_ssl_status` View

For each connection, this view displays the SSL version, cipher, and count of reused SSL sessions.

This view was added in MySQL 5.7.9.

The `session_ssl_status` view has these columns:

- `thread_id`

The thread ID for the connection.

- `ssl_version`

The version of SSL used for the connection.

- `ssl_cipher`

The SSL cipher used for the connection.

- `ssl_sessions_reused`

The number of reused SSL sessions for the connection.

### 26.4.3.35 The `statement_analysis` and `x$statement_analysis` Views

These views list normalized statements with aggregated statistics. The content mimics the MySQL Enterprise Monitor Query Analysis view. By default, rows are sorted by descending total latency.

The `statement_analysis` and `x$statement_analysis` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `rows_affected`

The total number of rows affected by occurrences of the statement.

- `rows_affected_avg`

The average number of rows affected per occurrence of the statement.

- `tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `tmp_disk_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `digest`

The statement digest.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

#### **26.4.3.36 The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` Views**

These views display normalized statements that have produced errors or warnings. By default, rows are sorted by descending error and warning counts.

The `statements_with_errors_or_warnings` and `x$statements_with_errors_or_warnings` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `errors`

The total number of errors produced by occurrences of the statement.

- `error_pct`

The percentage of statement occurrences that produced errors.

- `warnings`

The total number of warnings produced by occurrences of the statement.

- `warning_pct`

The percentage of statement occurrences that produced warnings.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 26.4.3.37 The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` Views

These views display normalized statements that have done full table scans. By default, rows are sorted by descending percentage of time a full scan was done and descending total latency.

The `statements_with_full_table_scans` and `x$statements_with_full_table_scans` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed statement events for the statement.

- `no_index_used_count`

The total number of times no index was used to scan the table.

- `no_good_index_used_count`

The total number of times no good index was used to scan the table.

- `no_index_used_pct`

The percentage of the time no index was used to scan the table.

- `rows_sent`

The total number of rows returned from the table.

- `rows_examined`

The total number of rows read from the storage engine for the table.

- `rows_sent_avg`

The average number of rows returned from the table.

- `rows_examined_avg`

The average number of rows read from the storage engine for the table.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 26.4.3.38 The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` Views

These views list statements with runtimes in the 95th percentile. By default, rows are sorted by descending average latency.

Both views use two helper views, `x$ps_digest_avg_latency_distribution` and `x$ps_digest_95th_percentile_by_avg_us`.

The `statements_with_runtimes_in_95th_percentile` and `x$statements_with_runtimes_in_95th_percentile` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `full_scan`

The total number of full table scans performed by occurrences of the statement.

- `exec_count`

The total number of times the statement has executed.

- `err_count`

The total number of errors produced by occurrences of the statement.

- `warn_count`

The total number of warnings produced by occurrences of the statement.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `max_latency`

The maximum single wait time of timed occurrences of the statement.

- `avg_latency`

The average wait time per timed occurrence of the statement.

- `rows_sent`

The total number of rows returned by occurrences of the statement.

- `rows_sent_avg`

The average number of rows returned per occurrence of the statement.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement.

- `rows_examined_avg`

The average number of rows read from storage engines per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

### 26.4.3.39 The `statements_with_sorting` and `x$statements_with_sorting` Views

These views list normalized statements that have performed sorts. By default, rows are sorted by descending total latency.

The `statements_with_sorting` and `x$statements_with_sorting` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `sort_merge_passes`

The total number of sort merge passes by occurrences of the statement.

- `avg_sort_merges`

The average number of sort merge passes per occurrence of the statement.

- `sorts_using_scans`

The total number of sorts using table scans by occurrences of the statement.

- `sort_using_range`

The total number of sorts using range accesses by occurrences of the statement.

- `rows_sorted`

The total number of rows sorted by occurrences of the statement.

- `avg_rows_sorted`

The average number of rows sorted per occurrence of the statement.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### 26.4.3.40 The `statements_with_temp_tables` and `x$statements_with_temp_tables` Views

These views list normalized statements that have used temporary tables. By default, rows are sorted by descending number of on-disk temporary tables used and descending number of in-memory temporary tables used.

The `statements_with_temp_tables` and `x$statements_with_temp_tables` views have these columns:

- `query`

The normalized statement string.

- `db`

The default database for the statement, or `NULL` if there is none.

- `exec_count`

The total number of times the statement has executed.

- `total_latency`

The total wait time of timed occurrences of the statement.

- `memory_tmp_tables`

The total number of internal in-memory temporary tables created by occurrences of the statement.

- `disk_tmp_tables`

The total number of internal on-disk temporary tables created by occurrences of the statement.

- `avg_tmp_tables_per_query`

The average number of internal temporary tables created per occurrence of the statement.

- `tmp_tables_to_disk_pct`

The percentage of internal in-memory temporary tables that were converted to on-disk tables.

- `first_seen`

The time at which the statement was first seen.

- `last_seen`

The time at which the statement was most recently seen.

- `digest`

The statement digest.

#### 26.4.3.41 The `user_summary` and `x$user_summary` Views

These views summarize statement activity, file I/O, and connections, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary` and `x$user_summary` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statements`

The total number of statements for the user.

- `statement_latency`

The total wait time of timed statements for the user.

- `statement_avg_latency`

The average wait time per timed statement for the user.

- `table_scans`

The total number of table scans for the user.

- `file_ios`

The total number of file I/O events for the user.

- `file_io_latency`

The total wait time of timed file I/O events for the user.

- `current_connections`

The current number of connections for the user.

- `total_connections`

The total number of connections for the user.

- `unique_hosts`

The number of distinct hosts from which connections for the user have originated.

- `current_memory`

The current amount of allocated memory for the user.

- `total_memory_allocated`

The total amount of allocated memory for the user.

#### 26.4.3.42 The `user_summary_by_file_io` and `x$user_summary_by_file_io` Views

These views summarize file I/O, grouped by user. By default, rows are sorted by descending total file I/O latency.

The `user_summary_by_file_io` and `x$user_summary_by_file_io` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `ios`

The total number of file I/O events for the user.

- `io_latency`

The total wait time of timed file I/O events for the user.

#### 26.4.3.43 The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` Views

These views summarize file I/O, grouped by user and event type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_file_io_type` and `x$user_summary_by_file_io_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The file I/O event name.

- `total`

The total number of occurrences of the file I/O event for the user.

- `latency`

The total wait time of timed occurrences of the file I/O event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the file I/O event for the user.

#### 26.4.3.44 The `user_summary_by_stages` and `x$user_summary_by_stages` Views

These views summarize stages, grouped by user. By default, rows are sorted by user and descending total stage latency.

The `user_summary_by_stages` and `x$user_summary_by_stages` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `event_name`

The stage event name.

- `total`

The total number of occurrences of the stage event for the user.

- `total_latency`

The total wait time of timed occurrences of the stage event for the user.

- `avg_latency`

The average wait time per timed occurrence of the stage event for the user.

#### 26.4.3.45 The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` Views

These views summarize overall statement statistics, grouped by user. By default, rows are sorted by descending total latency.

The `user_summary_by_statement_latency` and `x$user_summary_by_statement_latency` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `total`

The total number of statements for the user.

- `total_latency`

The total wait time of timed statements for the user.

- `max_latency`

The maximum single wait time of timed statements for the user.

- `lock_latency`

The total time waiting for locks by timed statements for the user.

- `rows_sent`

The total number of rows returned by statements for the user.

- `rows_examined`

The total number of rows read from storage engines by statements for the user.

- `rows_affected`

The total number of rows affected by statements for the user.

- `full_scans`

The total number of full table scans by statements for the user.

#### 26.4.3.46 The `user_summary_by_statement_type` and `x$user_summary_by_statement_type` Views

These views summarize information about statements executed, grouped by user and statement type. By default, rows are sorted by user and descending total latency.

The `user_summary_by_statement_type` and `x$user_summary_by_statement_type` views have these columns:

- `user`

The client user name. Rows for which the `USER` column in the underlying Performance Schema table is `NULL` are assumed to be for background threads and are reported with a host name of `background`.

- `statement`

The final component of the statement event name.

- `total`

The total number of occurrences of the statement event for the user.

- `total_latency`

The total wait time of timed occurrences of the statement event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the statement event for the user.

- `lock_latency`

The total time waiting for locks by timed occurrences of the statement event for the user.

- `rows_sent`

The total number of rows returned by occurrences of the statement event for the user.

- `rows_examined`

The total number of rows read from storage engines by occurrences of the statement event for the user.

- `rows_affected`

The total number of rows affected by occurrences of the statement event for the user.

- `full_scans`

The total number of full table scans by occurrences of the statement event for the user.

#### 26.4.3.47 The version View

This view provides the current `sys` schema and MySQL server versions.

The `version` view has these columns:

- `sys_version`

The `sys` schema version.

- `mysql_version`

The MySQL server version.

#### 26.4.3.48 The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` Views

These views summarize wait class average latencies, grouped by event class. By default, rows are sorted by descending average latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_avg_latency` and `x$wait_classes_global_by_avg_latency` views have these columns:

- `event_class`  
The event class.
- `total`  
The total number of occurrences of events in the class.
- `total_latency`  
The total wait time of timed occurrences of events in the class.
- `min_latency`  
The minimum single wait time of timed occurrences of events in the class.
- `avg_latency`  
The average wait time per timed occurrence of events in the class.
- `max_latency`  
The maximum single wait time of timed occurrences of events in the class.

#### 26.4.3.49 The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` Views

These views summarize wait class total latencies, grouped by event class. By default, rows are sorted by descending total latency. Idle events are ignored.

An event class is determined by stripping from the event name everything after the first three components. For example, the class for `wait/io/file/sql/slow_log` is `wait/io/file`.

The `wait_classes_global_by_latency` and `x$wait_classes_global_by_latency` views have these columns:

- `event_class`  
The event class.
- `total`  
The total number of occurrences of events in the class.
- `total_latency`  
The total wait time of timed occurrences of events in the class.
- `min_latency`  
The minimum single wait time of timed occurrences of events in the class.
- `avg_latency`

The average wait time per timed occurrence of events in the class.

- `max_latency`

The maximum single wait time of timed occurrences of events in the class.

#### 26.4.3.50 The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` Views

These views summarize wait events, grouped by host and event. By default, rows are sorted by host and descending total latency. Idle events are ignored.

The `waits_by_host_by_latency` and `x$waits_by_host_by_latency` views have these columns:

- `host`

The host from which the connection originated.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the host.

- `total_latency`

The total wait time of timed occurrences of the event for the host.

- `avg_latency`

The average wait time per timed occurrence of the event for the host.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the host.

#### 26.4.3.51 The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` Views

These views summarize wait events, grouped by user and event. By default, rows are sorted by user and descending total latency. Idle events are ignored.

The `waits_by_user_by_latency` and `x$waits_by_user_by_latency` views have these columns:

- `user`

The user associated with the connection.

- `event`

The event name.

- `total`

The total number of occurrences of the event for the user.

- `total_latency`

The total wait time of timed occurrences of the event for the user.

- `avg_latency`

The average wait time per timed occurrence of the event for the user.

- `max_latency`

The maximum single wait time of timed occurrences of the event for the user.

### 26.4.3.52 The `waits_global_by_latency` and `x$waits_global_by_latency` Views

These views summarize wait events, grouped by event. By default, rows are sorted by descending total latency. Idle events are ignored.

The `waits_global_by_latency` and `x$waits_global_by_latency` views have these columns:

- `events`

The event name.

- `total`

The total number of occurrences of the event.

- `total_latency`

The total wait time of timed occurrences of the event.

- `avg_latency`

The average wait time per timed occurrence of the event.

- `max_latency`

The maximum single wait time of timed occurrences of the event.

## 26.4.4 sys Schema Stored Procedures

The following sections describe `sys` schema stored procedures.

### 26.4.4.1 The `create_synonym_db()` Procedure

Given a schema name, this procedure creates a synonym schema containing views that refer to all the tables and views in the original schema. This can be used, for example, to create a shorter name by which to refer to a schema with a long name (such as `info` rather than `INFORMATION_SCHEMA`).

#### Parameters

- `in_db_name VARCHAR(64)`: The name of the schema for which to create the synonym.
- `in_synonym VARCHAR(64)`: The name to use for the synonym schema. This schema must not already exist.

#### Example

```
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| mysql |
| performance_schema |
| sys |
| world |
```

```

+-----+
mysql> CALL sys.create_synonym_db('INFORMATION_SCHEMA', 'info');
+-----+
| summary |
+-----+
| Created 63 views in the info database |
+-----+
mysql> SHOW DATABASES;
+-----+
| Database |
+-----+
| information_schema |
| info |
| mysql |
| performance_schema |
| sys |
| world |
+-----+
mysql> SHOW FULL TABLES FROM info;
+-----+ +-----+
| Tables_in_info | Table_type |
+-----+ +-----+
| character_sets | VIEW |
| collation_character_set_applicability | VIEW |
| collations | VIEW |
| column_privileges | VIEW |
| columns | VIEW |
| ... |

```

#### 26.4.4.2 The diagnostics() Procedure

Creates a report of the current server status for diagnostic purposes.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

Data collected for `diagnostics()` includes this information:

- Information from the `metrics` view (see [Section 26.4.3.21, “The metrics View”](#))
- Information from other relevant `sys` schema views, such as the one that determines queries in the 95th percentile
- Information from the `ndbinfo` schema, if the MySQL server is part of NDB Cluster
- Replication status (both master and slave)

Some of the `sys` schema views are calculated as initial (optional), overall, and delta values:

- The initial view is the content of the view at the start of the `diagnostics()` procedure. This output is the same as the start values used for the delta view. The initial view is included if the `diagnostics.include_raw` configuration option is `ON`.
- The overall view is the content of the view at the end of the `diagnostics()` procedure. This output is the same as the end values used for the delta view. The overall view is always included.
- The delta view is the difference from the beginning to the end of procedure execution. The minimum and maximum values are the minimum and maximum values from the end view, respectively. They do not necessarily reflect the minimum and maximum values in the monitored period. Except for the `metrics` view, the delta is calculated only between the first and last outputs.

#### Parameters

- `in_max_runtime INT UNSIGNED`: The maximum data collection time in seconds. Use `NULL` to collect data for the default of 60 seconds. Otherwise, use a value greater than 0.

- `in_interval` `INT UNSIGNED`: The sleep time between data collections in seconds. Use `NULL` to sleep for the default of 30 seconds. Otherwise, use a value greater than 0.
- `in_auto_config` `ENUM('current', 'medium', 'full')`: The Performance Schema configuration to use. Permitted values are:
  - `current`: Use the current instrument and consumer settings.
  - `medium`: Enable some instruments and consumers.
  - `full`: Enable all instruments and consumers.

#### Note

The more instruments and consumers enabled, the more impact on MySQL server performance. Be careful with the `medium` setting and especially the `full` setting, which has a large performance impact.

Use of the `medium` or `full` setting requires the `SUPER` privilege.

If a setting other than `current` is chosen, the current settings are restored at the end of the procedure.

## Configuration Options

`diagnostics()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 26.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `diagnostics.allow_i_s_tables`, `@sys.diagnostics.allow_i_s_tables`

If this option is `ON`, the `diagnostics()` procedure is permitted to perform table scans on the `INFORMATION_SCHEMA.TABLES` table. This can be expensive if there are many tables. The default is `OFF`.

- `diagnostics.include_raw`, `@sys.diagnostics.include_raw`

If this option is `ON`, the `diagnostics()` procedure output includes the raw output from querying the `metrics` view. The default is `OFF`.

- `statement_truncate_len`, `@sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

## Example

Create a diagnostics report that starts an iteration every 30 seconds and runs for at most 120 seconds using the current Performance Schema settings:

```
mysql> CALL sys.diagnostics(120, 30, 'current');
```

To capture the output from the `diagnostics()` procedure in a file as it runs, use the `mysql` client `tee filename` and `notee` commands (see [Section 4.5.1.2, “mysql Commands”](#)):

```
mysql> tee diag.out;
mysql> CALL sys.diagnostics(120, 30, 'current');
mysql> notee;
```

### 26.4.4.3 The `execute_prepared_stmt()` Procedure

Given an SQL statement as a string, executes it as a prepared statement. The prepared statement is deallocated after execution, so it is not subject to reuse. Thus, this procedure is useful primarily for executing dynamic statements on a one-time basis.

This procedure uses `sys_execute_prepared_stmt` as the prepared statement name. If that statement name exists when the procedure is called, its previous content is destroyed.

This procedure was added in MySQL 5.7.9.

#### Parameters

- `in_query` `LONGTEXT CHARACTER SET utf8`: The statement string to execute.

#### Configuration Options

`execute_prepared_stmt()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 26.4.2.1](#), “The `sys_config` Table”):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

#### Example

```
mysql> CALL sys.execute_prepared_stmt('SELECT COUNT(*) FROM mysql.user');
+-----+
| COUNT(*) |
+-----+
|      15  |
+-----+
```

### 26.4.4.4 The `ps_setup_disable_background_threads()` Procedure

Disables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were disabled. Already disabled threads do not count.

#### Parameters

None.

#### Example

```
mysql> CALL sys.ps_setup_disable_background_threads();
+-----+
| summary |
+-----+
| Disabled 24 background threads |
+-----+
```

### 26.4.4.5 The `ps_setup_disable_consumer()` Procedure

Disables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were disabled. Already disabled consumers do not count.

#### Parameters

- `consumer` `VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

## Example

Disable all statement consumers:

```
mysql> CALL sys.ps_setup_disable_consumer('statement');
+-----+
| summary |
+-----+
| Disabled 4 consumers |
+-----+
```

### 26.4.4.6 The ps\_setup\_disable\_instrument() Procedure

Disables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were disabled. Already disabled instruments do not count.

#### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all instruments.

## Example

Disable a specific instrument:

```
mysql> CALL sys.ps_setup_disable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary |
+-----+
| Disabled 1 instrument |
+-----+
```

Disable all mutex instruments:

```
mysql> CALL sys.ps_setup_disable_instrument('mutex');
+-----+
| summary |
+-----+
| Disabled 177 instruments |
+-----+
```

### 26.4.4.7 The ps\_setup\_disable\_thread() Procedure

Given a connection ID, disables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were disabled. Already disabled threads do not count.

#### Parameters

- `in_connection_id BIGINT`: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

## Example

Disable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_disable_thread(225);
+-----+
| summary |
+-----+
```

```
| Disabled 1 thread |
+-----+
```

Disable the current connection:

```
mysql> CALL sys.ps_setup_disable_thread(CONNECTION_ID());
+-----+
| summary |
+-----+
| Disabled 1 thread |
+-----+
```

#### 26.4.4.8 The `ps_setup_enable_background_threads()` Procedure

Enables Performance Schema instrumentation for all background threads. Produces a result set indicating how many background threads were enabled. Already enabled threads do not count.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_enable_background_threads();
+-----+
| summary |
+-----+
| Enabled 24 background threads |
+-----+
```

#### 26.4.4.9 The `ps_setup_enable_consumer()` Procedure

Enables Performance Schema consumers with names that contain the argument. Produces a result set indicating how many consumers were enabled. Already enabled consumers do not count.

##### Parameters

- `consumer VARCHAR(128)`: The value used to match consumer names, which are identified by using `%consumer%` as an operand for a `LIKE` pattern match.

A value of `' '` matches all consumers.

##### Example

Enable all statement consumers:

```
mysql> CALL sys.ps_setup_enable_consumer('statement');
+-----+
| summary |
+-----+
| Enabled 4 consumers |
+-----+
```

#### 26.4.4.10 The `ps_setup_enable_instrument()` Procedure

Enables Performance Schema instruments with names that contain the argument. Produces a result set indicating how many instruments were enabled. Already enabled instruments do not count.

##### Parameters

- `in_pattern VARCHAR(128)`: The value used to match instrument names, which are identified by using `%in_pattern%` as an operand for a `LIKE` pattern match.

A value of '' matches all instruments.

### Example

Enable a specific instrument:

```
mysql> CALL sys.ps_setup_enable_instrument('wait/lock/metadata/sql/mdl');
+-----+
| summary                |
+-----+
| Enabled 1 instrument   |
+-----+
```

Enable all mutex instruments:

```
mysql> CALL sys.ps_setup_enable_instrument('mutex');
+-----+
| summary                |
+-----+
| Enabled 177 instruments |
+-----+
```

#### 26.4.4.11 The ps\_setup\_enable\_thread() Procedure

Given a connection ID, enables Performance Schema instrumentation for the thread. Produces a result set indicating how many threads were enabled. Already enabled threads do not count.

### Parameters

- `in_connection_id` **BIGINT**: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

### Example

Enable a specific connection by its connection ID:

```
mysql> CALL sys.ps_setup_enable_thread(225);
+-----+
| summary                |
+-----+
| Enabled 1 thread       |
+-----+
```

Enable the current connection:

```
mysql> CALL sys.ps_setup_enable_thread(CONNECTION_ID());
+-----+
| summary                |
+-----+
| Enabled 1 thread       |
+-----+
```

#### 26.4.4.12 The ps\_setup\_reload\_saved() Procedure

Reloads a Performance Schema configuration saved earlier within the same session using `ps_setup_save()`. For more information, see the description of `ps_setup_save()`.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

## Parameters

None.

### 26.4.4.13 The `ps_setup_reset_to_default()` Procedure

Resets the Performance Schema configuration to its default settings.

## Parameters

- `in_verbose` `BOOLEAN`: Whether to display information about each setup stage during procedure execution. This includes the SQL statements executed.

## Example

```
mysql> CALL sys.ps_setup_reset_to_default(TRUE)\G
***** 1. row *****
status: Resetting: setup_actors
DELETE
FROM performance_schema.setup_actors
WHERE NOT (HOST = '%' AND USER = '%' AND ROLE = '%')

***** 1. row *****
status: Resetting: setup_actors
INSERT IGNORE INTO performance_schema.setup_actors
VALUES ('%', '%', '%')
...

```

### 26.4.4.14 The `ps_setup_save()` Procedure

Saves the current Performance Schema configuration. This enables you to alter the configuration temporarily for debugging or other purposes, then restore it to the previous state by invoking the `ps_setup_reload_saved()` procedure.

To prevent other simultaneous calls to save the configuration, `ps_setup_save()` acquires an advisory lock named `sys.ps_setup_save` by calling the `GET_LOCK()` function. `ps_setup_save()` takes a timeout parameter to indicate how many seconds to wait if the lock already exists (which indicates that some other session has a saved configuration outstanding). If the timeout expires without obtaining the lock, `ps_setup_save()` fails.

It is intended you call `ps_setup_reload_saved()` later within the *same* session as `ps_setup_save()` because the configuration is saved in `TEMPORARY` tables. `ps_setup_save()` drops the temporary tables and releases the lock. If you end your session without invoking `ps_setup_save()`, the tables and lock disappear automatically.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

## Parameters

- `in_timeout` `INT`: How many seconds to wait to obtain the `sys.ps_setup_save` lock. A negative timeout value means infinite timeout.

## Example

```
mysql> CALL sys.ps_setup_save(10);

... make Performance Schema configuration changes ...

```

```
mysql> CALL sys.ps_setup_reload_saved();
```

#### 26.4.4.15 The `ps_setup_show_disabled()` Procedure

Displays all currently disabled Performance Schema configuration.

##### Parameters

- `in_show_instruments` `BOOLEAN`: Whether to display disabled instruments. This might be a long list.
- `in_show_threads` `BOOLEAN`: Whether to display disabled threads.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled(TRUE, TRUE);
```

+-----+

+-----+				

...

#### 26.4.4.16 The `ps_setup_show_disabled_consumers()` Procedure

Displays all currently disabled Performance Schema consumers.

##### Parameters

None.

##### Example

```
mysql> CALL sys.ps_setup_show_disabled_consumers();
```

+-----+	
disabled_consumers	
+-----+	
events_stages_current	
events_stages_history	

```

| events_stages_history_long |

| events_transactions_history |
| events_transactions_history_long |
| events_waits_current |
| events_waits_history |
| events_waits_history_long |
+-----+

```

#### 26.4.4.17 The `ps_setup_show_disabled_instruments()` Procedure

Displays all currently disabled Performance Schema instruments. This might be a long list.

##### Parameters

None.

##### Example

```

mysql> CALL sys.ps_setup_show_disabled_instruments()\G
***** 1. row *****
disabled_instruments: wait/synch/mutex/sql/TC_LOG_MMAP::LOCK_tc
                    timed: NO
***** 2. row *****
disabled_instruments: wait/synch/mutex/sql/THD::LOCK_query_plan
                    timed: NO
***** 3. row *****
disabled_instruments: wait/synch/mutex/sql/MYSQL_BIN_LOG::LOCK_commit
                    timed: NO
...

```

#### 26.4.4.18 The `ps_setup_show_enabled()` Procedure

Displays all currently enabled Performance Schema configuration.

##### Parameters

- `in_show_instruments` `BOOLEAN`: Whether to display enabled instruments. This might be a long list.
- `in_show_threads` `BOOLEAN`: Whether to display enabled threads.

##### Example

```

mysql> CALL sys.ps_setup_show_enabled(FALSE, FALSE);
+-----+
| performance_schema_enabled |
+-----+
| 1 |
+-----+
1 row in set (0.00 sec)

+-----+

| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+

```

#### 26.4.4.19 The `ps_setup_show_enabled_consumers()` Procedure

Displays all currently enabled Performance Schema consumers.

##### Parameters

None.

##### Example

```

mysql> CALL sys.ps_setup_show_enabled_consumers();
+-----+
| enabled_consumers |
+-----+
| events_statements_current |
| events_statements_history |
| global_instrumentation |
| statements_digest |
| thread_instrumentation |
+-----+

```

#### 26.4.4.20 The `ps_setup_show_enabled_instruments()` Procedure

Displays all currently enabled Performance Schema instruments. This might be a long list.

##### Parameters

None.

##### Example

```

mysql> CALL sys.ps_setup_show_enabled_instruments()\G
***** 1. row *****
enabled_instruments: wait/io/file/sql/map
        timed: YES
***** 2. row *****
enabled_instruments: wait/io/file/sql/binlog
        timed: YES
***** 3. row *****
enabled_instruments: wait/io/file/sql/binlog_cache
        timed: YES
...

```

#### 26.4.4.21 The `ps_statement_avg_latency_histogram()` Procedure

Displays a textual histogram graph of the average latency values across all normalized statements tracked within the Performance Schema `events_statements_summary_by_digest` table.

This procedure can be used to display a very high-level picture of the latency distribution of statements running within this MySQL instance.

## Parameters

None.

## Example

The histogram output in statement units. For example, `* = 2 units` in the histogram legend means that each `*` character represents 2 statements.

```
mysql> CALL sys.ps_statement_avg_latency_histogram()\G
***** 1. row *****
Performance Schema Statement Digest Average Latency Histogram:

. = 1 unit
* = 2 units
# = 3 units

(0 - 66ms)      88 | #####
(66 - 133ms)   14 | .....
(133 - 199ms)   4  | ....
(199 - 265ms)   5  | **
(265 - 332ms)   1  | .
(332 - 398ms)   0  |
(398 - 464ms)   1  | .
(464 - 531ms)   0  |
(531 - 597ms)   0  |
(597 - 663ms)   0  |
(663 - 730ms)   0  |
(730 - 796ms)   0  |
(796 - 863ms)   0  |
(863 - 929ms)   0  |
(929 - 995ms)   0  |
(995 - 1062ms)  0  |

Total Statements: 114; Buckets: 16; Bucket Size: 66 ms;
```

### 26.4.4.22 The `ps_trace_statement_digest()` Procedure

Traces all Performance Schema instrumentation for a specific statement digest.

If you find a statement of interest within the Performance Schema `events_statements_summary_by_digest` table, specify its `DIGEST` column MD5 value to this procedure and indicate the polling duration and interval. The result is a report of all statistics tracked within Performance Schema for that digest for the interval.

The procedure also attempts to execute `EXPLAIN` for the longest running example of the digest during the interval. This attempt might fail because the Performance Schema truncates long `SQL_TEXT` values. Consequently, `EXPLAIN` will fail due to parse errors.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

## Parameters

- `in_digest` `VARCHAR(32)`: The statement digest identifier to analyze.
- `in_runtime` `INT`: How long to run the analysis in seconds.
- `in_interval` `DECIMAL(2,2)`: The analysis interval in seconds (which can be fractional) at which to try to take snapshots.
- `in_start_fresh` `BOOLEAN`: Whether to truncate the Performance Schema `events_statements_history_long` and `events_stages_history_long` tables before starting.

- `in_auto_enable` `BOOLEAN`: Whether to automatically enable required consumers.

## Example

```
mysql> CALL sys.ps_trace_statement_digest('891ec6860f98ba46d89dd20b0c03652c', 10, 0.1, TRUE, TRUE);
```

### 26.4.4.23 The `ps_trace_thread()` Procedure

Dumps all Performance Schema data for an instrumented thread to a `.dot` formatted graph file (for the DOT graph description language). Each result set returned from the procedure should be used for a complete graph.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

#### Parameters

- `in_thread_id` `INT`: The thread to trace.
- `in_outfile` `VARCHAR(255)`: The name to use for the `.dot` output file.
- `in_max_runtime` `DECIMAL(20,2)`: The maximum number of seconds (which can be fractional) to collect data. Use `NULL` to collect data for the default of 60 seconds.
- `in_interval` `DECIMAL(20,2)`: The number of seconds (which can be fractional) to sleep between data collections. Use `NULL` to sleep for the default of 1 second.
- `in_start_fresh` `BOOLEAN`: Whether to reset all Performance Schema data before tracing.
- `in_auto_setup` `BOOLEAN`: Whether to disable all other threads and enable all instruments and consumers. This also resets the settings at the end of the run.
- `in_debug` `BOOLEAN`: Whether to include `file:lineno` information in the graph.

#### Example

```

mysql> CALL sys.ps_trace_thread(25, CONCAT('/tmp/stack-', REPLACE(NOW(), ' ', '-'), '.dot'), NULL, NULL,
+-----+-----+
| summary |
+-----+-----+
| Disabled 1 thread |
+-----+-----+

+-----+-----+
| Convert to PDF |
+-----+-----+
| dot -Tpdf -o /tmp/stack_25.pdf /tmp/stack-2014-02-16-21:18:41.dot |
+-----+-----+
1 row in set (60.07 sec)

+-----+-----+
| Convert to PNG |
+-----+-----+

```

```

+-----+
| dot -Tpng -o /tmp/stack_25.png /tmp/stack-2014-02-16-21:18:41.dot |
+-----+
1 row in set (60.07 sec)

+-----+
| summary |
+-----+
| Enabled 1 thread |
+-----+
1 row in set (60.32 sec)

```

#### 26.4.4.24 The `ps_truncate_all_tables()` Procedure

Truncates all Performance Schema summary tables, resetting all aggregated instrumentation as a snapshot. Produces a result set indicating how many tables were truncated.

##### Parameters

- `in_verbose` **BOOLEAN**: Whether to display each `TRUNCATE TABLE` statement before executing it.

##### Example

```

mysql> CALL sys.ps_truncate_all_tables(FALSE);
+-----+
| summary |
+-----+
| Truncated 44 tables |
+-----+

```

#### 26.4.4.25 The `statement_performance_analyzer()` Procedure

Creates a report of the statements running on the server. The views are calculated based on the overall and/or delta activity.

This procedure disables binary logging during its execution by manipulating the session value of the `sql_log_bin` system variable. That is a restricted operation, so the procedure requires privileges sufficient to set restricted session variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

This procedure was added in MySQL 5.7.9.

##### Parameters

- `in_action` **ENUM**('snapshot', 'overall', 'delta', 'create\_tmp', 'create\_table', 'save', 'cleanup'): The action to take. These values are permitted:
  - snapshot**: Store a snapshot. The default is to make a snapshot of the current content of the Performance Schema `events_statements_summary_by_digest` table. By setting `in_table`, this can be overwritten to copy the content of the specified table. The snapshot is stored in the `sys` schema `tmp_digests` temporary table.
  - overall**: Generate an analysis based on the content of the table specified by `in_table`. For the overall analysis, `in_table` can be `NOW()` to use a fresh snapshot. This overwrites an existing snapshot. Use `NULL` for `in_table` to use the existing snapshot. If `in_table` is `NULL` and no snapshot exists, a new snapshot is created. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.
  - delta**: Generate a delta analysis. The delta is calculated between the reference table specified by `in_table` and the snapshot, which must exist. This action uses the `sys` schema `tmp_digests_delta` temporary table. The `in_views` parameter and the `statement_performance_analyzer.limit` configuration option affect the operation of this procedure.

- `create_table`: Create a regular table suitable for storing the snapshot for later use (for example, for calculating deltas).
- `create_tmp`: Create a temporary table suitable for storing the snapshot for later use (for example, for calculating deltas).
- `save`: Save the snapshot in the table specified by `in_table`. The table must exist and have the correct structure. If no snapshot exists, a new snapshot is created.
- `cleanup`: Remove the temporary tables used for the snapshot and delta.
- `in_table VARCHAR(129)`: The table parameter used for some of the actions specified by the `in_action` parameter. Use the format `db_name.tbl_name` or `tbl_name` without using any backtick (``) identifier-quoting characters. Periods (.) are not supported in database and table names.

The meaning of the `in_table` value for each `in_action` value is detailed in the individual `in_action` value descriptions.

- `in_views SET ('with_runtimes_in_95th_percentile', 'analysis', 'with_errors_or_warnings', 'with_full_table_scans', 'with_sorting', 'with_temp_tables', 'custom')`: Which views to include. This parameter is a `SET` value, so it can contain multiple view names, separated by commas. The default is to include all views except `custom`. The following values are permitted:
  - `with_runtimes_in_95th_percentile`: Use the `statements_with_runtimes_in_95th_percentile` view.
  - `analysis`: Use the `statement_analysis` view.
  - `with_errors_or_warnings`: Use the `statements_with_errors_or_warnings` view.
  - `with_full_table_scans`: Use the `statements_with_full_table_scans` view.
  - `with_sorting`: Use the `statements_with_sorting` view.
  - `with_temp_tables`: Use the `statements_with_temp_tables` view.
  - `custom`: Use a custom view. This view must be specified using the `statement_performance_analyzer.view` configuration option to name a query or an existing view.

## Configuration Options

`statement_performance_analyzer()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 26.4.2.1, “The sys\\_config Table”](#)):

- `debug`, `@sys.debug`

If this option is `ON`, produce debugging output. The default is `OFF`.

- `statement_performance_analyzer.limit`,  
`@sys.statement_performance_analyzer.limit`

The maximum number of rows to return for views that have no built-in limit. The default is 100.

- `statement_performance_analyzer.view`,  
`@sys.statement_performance_analyzer.view`

The custom query or view to be used. If the option value contains a space, it is interpreted as a query. Otherwise, it must be the name of an existing view that queries the Performance Schema

`events_statements_summary_by_digest` table. There cannot be any `LIMIT` clause in the query or view definition if the `statement_performance_analyzer.limit` configuration option is greater than 0. If specifying a view, use the same format as for the `in_table` parameter. The default is `NULL` (no custom view defined).

This option was added in MySQL 5.7.9.

## Example

To create a report with the queries in the 95th percentile since the last truncation of `events_statements_summary_by_digest` and with a one-minute delta period:

1. Create a temporary table to store the initial snapshot.
2. Create the initial snapshot.
3. Save the initial snapshot in the temporary table.
4. Wait one minute.
5. Create a new snapshot.
6. Perform analysis based on the new snapshot.
7. Perform analysis based on the delta between the initial and new snapshots.

```
mysql> CALL sys.statement_performance_analyzer('create_tmp', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.08 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('save', 'mydb.tmp_digests_ini', NULL);
Query OK, 0 rows affected (0.00 sec)

mysql> DO SLEEP(60);
Query OK, 0 rows affected (1 min 0.00 sec)

mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.02 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.05 sec)

...

mysql> CALL sys.statement_performance_analyzer('delta', 'mydb.tmp_digests_ini', 'with_runtimes_in_95th_percentile');
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.03 sec)

...
```

Create an overall report of the 95th percentile queries and the top 10 queries with full table scans:

```
mysql> CALL sys.statement_performance_analyzer('snapshot', NULL, NULL);
Query OK, 0 rows affected (0.01 sec)
```

```
mysql> SET @sys.statement_performance_analyzer.limit = 10;
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.statement_performance_analyzer('overall', NULL, 'with_runtimes_in_95th_percentile,with_
+-----+
| Next Output |
+-----+
| Queries with Runtime in 95th Percentile |
+-----+
1 row in set (0.01 sec)

...

+-----+
| Next Output |
+-----+
| Top 10 Queries with Full Table Scan |
+-----+
1 row in set (0.09 sec)

...
```

Use a custom view showing the top 10 queries sorted by total execution time, refreshing the view every minute using the `watch` command in Linux:

```
mysql> CREATE OR REPLACE VIEW mydb.my_statements AS
SELECT sys.format_statement(DIGEST_TEXT) AS query,
       SCHEMA_NAME AS db,
       COUNT_STAR AS exec_count,
       sys.format_time(SUM_TIMER_WAIT) AS total_latency,
       sys.format_time(AVG_TIMER_WAIT) AS avg_latency,
       ROUND(IFNULL(SUM_ROWS_SENT / NULLIF(COUNT_STAR, 0), 0)) AS rows_sent_avg,
       ROUND(IFNULL(SUM_ROWS_EXAMINED / NULLIF(COUNT_STAR, 0), 0)) AS rows_examined_avg,
       ROUND(IFNULL(SUM_ROWS_AFFECTED / NULLIF(COUNT_STAR, 0), 0)) AS rows_affected_avg,
       DIGEST AS digest
FROM performance_schema.events_statements_summary_by_digest
ORDER BY SUM_TIMER_WAIT DESC;
Query OK, 0 rows affected (0.10 sec)

mysql> CALL sys.statement_performance_analyzer('create_table', 'mydb.digests_prev', NULL);
Query OK, 0 rows affected (0.10 sec)

shell> watch -n 60 "mysql sys --table -e \"
> SET @sys.statement_performance_analyzer.view = 'mydb.my_statements';
> SET @sys.statement_performance_analyzer.limit = 10;
> CALL statement_performance_analyzer('snapshot', NULL, NULL);
> CALL statement_performance_analyzer('delta', 'mydb.digests_prev', 'custom');
> CALL statement_performance_analyzer('save', 'mydb.digests_prev', NULL);
> \"\"

Every 60.0s: mysql sys --table -e "          ... Mon Dec 22 10:58:51 2014

+-----+
| Next Output |
+-----+
| Top 10 Queries Using Custom View |
+-----+

+-----+-----+-----+-----+-----+-----+
| query          | db    | exec_count | total_latency | avg_latency | rows_sent_avg | rows_examined_avg |
+-----+-----+-----+-----+-----+-----+
...
```

#### 26.4.4.26 The `table_exists()` Procedure

Tests whether a given table exists as a regular table, a `TEMPORARY` table, or a view. The procedure returns the table type in an `OUT` parameter. If both a temporary and a permanent table exist with the given name, `TEMPORARY` is returned.

This procedure was added in MySQL 5.7.9.

## Parameters

- `in_db VARCHAR(64)`: The name of the database in which to check for table existence.
- `in_table VARCHAR(64)`: The name of the table to check the existence of.
- `out_exists ENUM('', 'BASE TABLE', 'VIEW', 'TEMPORARY')`: The return value. This is an `OUT` parameter, so it must be a variable into which the table type can be stored. When the procedure returns, the variable has one of the following values to indicate whether the table exists:
  - `''`: The table name does not exist as a base table, `TEMPORARY` table, or view.
  - `BASE TABLE`: The table name exists as a base (permanent) table.
  - `VIEW`: The table name exists as a view.
  - `TEMPORARY`: The table name exists as a `TEMPORARY` table.

## Example

```
mysql> CREATE DATABASE db1;
Query OK, 1 row affected (0.01 sec)

mysql> USE db1;
Database changed
mysql> CREATE TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.03 sec)

mysql> CREATE TABLE t2 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.20 sec)

mysql> CREATE view v_t1 AS SELECT * FROM t1;
Query OK, 0 rows affected (0.02 sec)

mysql> CREATE TEMPORARY TABLE t1 (id INT PRIMARY KEY);
Query OK, 0 rows affected (0.00 sec)

mysql> CALL sys.table_exists('db1', 't1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.01 sec)

+-----+
| @exists |
+-----+
| TEMPORARY |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't2', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| BASE TABLE |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 'v_t1', @exists); SELECT @exists;
Query OK, 0 rows affected (0.02 sec)

+-----+
| @exists |
+-----+
| VIEW |
+-----+
1 row in set (0.00 sec)

mysql> CALL sys.table_exists('db1', 't3', @exists); SELECT @exists;
Query OK, 0 rows affected (0.00 sec)
```

```

+-----+
| @exists |
+-----+
|         |
+-----+
1 row in set (0.00 sec)

```

## 26.4.5 sys Schema Stored Functions

The following sections describe `sys` schema stored functions.

### 26.4.5.1 The `extract_schema_from_file_name()` Function

Given a file path name, returns the path component that represents the schema name. This function assumes that the file name lies within the schema directory. For this reason, it will not work with partitions or tables defined using their own `DATA_DIRECTORY` table option.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display schema names, which can be more easily understood than full path names, and can be used in joins against object schema names.

#### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the schema name.

#### Return Value

A `VARCHAR(64)` value.

#### Example

```

mysql> SELECT sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_schema_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+
| world |
+-----+

```

### 26.4.5.2 The `extract_table_from_file_name()` Function

Given a file path name, returns the path component that represents the table name.

This function is useful when extracting file I/O information from the Performance Schema that includes file path names. It provides a convenient way to display table names, which can be more easily understood than full path names, and can be used in joins against object table names.

#### Parameters

- `path VARCHAR(512)`: The full path to a data file from which to extract the table name.

#### Return Value

A `VARCHAR(64)` value.

#### Example

```

mysql> SELECT sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.extract_table_from_file_name('/usr/local/mysql/data/world/City.ibd') |
+-----+

```

City
------

### 26.4.5.3 The format\_bytes() Function

Given a value in bytes, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `bytes`, `KiB` (kibibytes), `MiB` (mebibytes), `GiB` (gibibytes), `TiB` (tebibytes), or `PiB` (pebibytes).

#### Parameters

- `bytes TEXT`: The bytes value to format.

#### Return Value

A `TEXT` value.

#### Example

```
mysql> SELECT sys.format_bytes(512), sys.format_bytes(18446644073709551615);
+-----+-----+
| sys.format_bytes(512) | sys.format_bytes(18446644073709551615) |
+-----+-----+
| 512 bytes           | 16383.91 PiB                          |
+-----+-----+
```

### 26.4.5.4 The format\_path() Function

Given a path name, returns the modified path name after replacing subpaths that match the values of the following system variables, in order:

```
datadir
tmpdir
slave_load_tmpdir
innodb_data_home_dir
innodb_log_group_home_dir
innodb_undo_directory
basedir
```

A value that matches the value of system variable `sysvar` is replaced with the string `@@global.sysvar`.

Prior to MySQL 5.7.14, backslashes in Windows path names are converted to forward slashes in the result.

#### Parameters

- `path VARCHAR(512)`: The path name to format.

#### Return Value

A `VARCHAR(512) CHARACTER SET utf8` value.

#### Example

```
mysql> SELECT sys.format_path('/usr/local/mysql/data/world/City.ibd');
+-----+
| sys.format_path('/usr/local/mysql/data/world/City.ibd') |
+-----+
| /usr/local/mysql/data/world/City.ibd                    |
+-----+
```

### 26.4.5.5 The `format_statement()` Function

Given a string (normally representing an SQL statement), reduces it to the length given by the `statement_truncate_len` configuration option, and returns the result. No truncation occurs if the string is shorter than `statement_truncate_len`. Otherwise, the middle part of the string is replaced by an ellipsis (...).

This function is useful for formatting possibly lengthy statements retrieved from Performance Schema tables to a known fixed maximum length.

#### Parameters

- `statement` `LONGTEXT`: The statement to format.

#### Configuration Options

`format_statement()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 26.4.2.1, “The sys\\_config Table”](#)):

- `statement_truncate_len`, `@sys.statement_truncate_len`

The maximum length of statements returned by the `format_statement()` function. Longer statements are truncated to this length. The default is 64.

#### Return Value

A `LONGTEXT` value.

#### Example

By default, `format_statement()` truncates statements to be no more than 64 characters. Setting `@sys.statement_truncate_len` changes the truncation length for the current session:

```
mysql> SET @stmt = 'SELECT variable, value, set_time, set_by FROM sys_config';
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variable, value, set_time, set_by FROM sys_config |
+-----+
mysql> SET @sys.statement_truncate_len = 32;
mysql> SELECT sys.format_statement(@stmt);
+-----+
| sys.format_statement(@stmt) |
+-----+
| SELECT variabl ... ROM sys_config |
+-----+
```

### 26.4.5.6 The `format_time()` Function

Given a Performance Schema latency or wait time in picoseconds, converts it to human-readable format and returns a string consisting of a value and a units indicator. Depending on the size of the value, the units part is `ns` (nanoseconds), `us` (microseconds), `ms` (milliseconds), `s` (seconds), `m` (minutes), `h` (hours), `d` (days), or `w` (weeks).

#### Parameters

- `picoseconds` `TEXT`: The picoseconds value to format.

#### Return Value

A `TEXT` value.

## Example

```
mysql> SELECT sys.format_time(3501), sys.format_time(188732396662000);
+-----+-----+
| sys.format_time(3501) | sys.format_time(188732396662000) |
+-----+-----+
| 3.50 ns                | 3.15 m                            |
+-----+-----+
```

### 26.4.5.7 The list\_add() Function

Adds a value to a comma-separated list of values and returns the result.

This function and `list_drop()` can be useful for manipulating the value of system variables such as `sql_mode` and `optimizer_switch` that take a comma-separated list of values.

This function was added in MySQL 5.7.9.

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_add_value TEXT`: The value to add to the list.

#### Return Value

A `TEXT` value.

## Example

```
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode                |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES |
+-----+
mysql> SET @@sql_mode = sys.list_add(@@sql_mode, 'NO_ENGINE_SUBSTITUTION');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode                |
+-----+
| ONLY_FULL_GROUP_BY,STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+
mysql> SET @@sql_mode = sys.list_drop(@@sql_mode, 'ONLY_FULL_GROUP_BY');
mysql> SELECT @@sql_mode;
+-----+
| @@sql_mode                |
+-----+
| STRICT_TRANS_TABLES,NO_ENGINE_SUBSTITUTION |
+-----+
```

### 26.4.5.8 The list\_drop() Function

Removes a value from a comma-separated list of values and returns the result. For more information, see the description of `list_add()`

This function was added in MySQL 5.7.9.

#### Parameters

- `in_list TEXT`: The list to be modified.
- `in_drop_value TEXT`: The value to drop from the list.

## Return Value

A [TEXT](#) value.

### 26.4.5.9 The `ps_is_account_enabled()` Function

Returns [YES](#) or [NO](#) to indicate whether Performance Schema instrumentation for a given account is enabled.

## Parameters

- `in_host` [VARCHAR\(60\)](#): The host name of the account to check.
- `in_user` [VARCHAR\(32\)](#): The user name of the account to check.

## Return Value

An [ENUM\('YES', 'NO'\)](#) value.

## Example

```
mysql> SELECT sys.ps_is_account_enabled('localhost', 'root');
+-----+
| sys.ps_is_account_enabled('localhost', 'root') |
+-----+
| YES                                           |
+-----+
```

### 26.4.5.10 The `ps_is_consumer_enabled()` Function

Returns [YES](#) or [NO](#) to indicate whether a given Performance Schema consumer is enabled, or [NULL](#) if the argument is not a valid consumer name.

This function accounts for the consumer hierarchy, so a consumer is not considered enabled unless all consumers on which depends are also enabled. For information about the consumer hierarchy, see [Section 25.4.7, “Pre-Filtering by Consumer”](#).

## Parameters

- `in_consumer` [VARCHAR\(64\)](#): The name of the consumer to check.

## Return Value

An [ENUM\('YES', 'NO'\)](#) value.

## Example

```
mysql> SELECT sys.ps_is_consumer_enabled('thread_instrumentation');
+-----+
| sys.ps_is_consumer_enabled('thread_instrumentation') |
+-----+
| YES                                           |
+-----+
```

### 26.4.5.11 The `ps_is_instrument_default_enabled()` Function

Returns [YES](#) or [NO](#) to indicate whether a given Performance Schema instrument is enabled by default.

## Parameters

- `in_instrument` [VARCHAR\(128\)](#): The name of the instrument to check.

## Return Value

An `ENUM( 'YES' , 'NO' )` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_enabled('memory/innodb/row_log_buf') |
+-----+
| NO                                                                    |
+-----+
mysql> SELECT sys.ps_is_instrument_default_enabled('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_enabled('statement/sql/alter_user') |
+-----+
| YES                                                                |
+-----+
```

### 26.4.5.12 The `ps_is_instrument_default_timed()` Function

Returns `YES` or `NO` to indicate whether a given Performance Schema instrument is timed by default.

## Parameters

- `in_instrument` `VARCHAR(128)`: The name of the instrument to check.

## Return Value

An `ENUM( 'YES' , 'NO' )` value.

## Example

```
mysql> SELECT sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf');
+-----+
| sys.ps_is_instrument_default_timed('memory/innodb/row_log_buf') |
+-----+
| NO                                                                    |
+-----+
mysql> SELECT sys.ps_is_instrument_default_timed('statement/sql/alter_user');
+-----+
| sys.ps_is_instrument_default_timed('statement/sql/alter_user') |
+-----+
| YES                                                                |
+-----+
```

### 26.4.5.13 The `ps_is_thread_instrumented()` Function

Returns `YES` or `NO` to indicate whether Performance Schema instrumentation for a given connection ID is enabled, `UNKNOWN` if the ID is unknown, or `NULL` if the ID is `NULL`.

## Parameters

- `in_connection_id` `BIGINT UNSIGNED`: The connection ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

## Return Value

An `ENUM( 'YES' , 'NO' , 'UNKNOWN' )` value.

## Example

```
mysql> SELECT sys.ps_is_thread_instrumented(43);
+-----+
| sys.ps_is_thread_instrumented(43) |
+-----+
| UNKNOWN                           |
+-----+
mysql> SELECT sys.ps_is_thread_instrumented(CONNECTION_ID());
+-----+
| sys.ps_is_thread_instrumented(CONNECTION_ID()) |
+-----+
| YES                                             |
+-----+
```

#### 26.4.5.14 The ps\_thread\_account() Function

Given a Performance Schema thread ID, returns the `user_name@host_name` account associated with the thread.

This function was added in MySQL 5.7.9.

##### Parameters

- `in_thread_id` **BIGINT UNSIGNED**: The thread ID for which to return the account. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

##### Return Value

A **TEXT** value.

##### Example

```
mysql> SELECT sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID()));
+-----+
| sys.ps_thread_account(sys.ps_thread_id(CONNECTION_ID())) |
+-----+
| root@localhost                                           |
+-----+
```

#### 26.4.5.15 The ps\_thread\_id() Function

Returns the Performance Schema thread ID for a given connection ID, or the thread ID for the current connection if the connection ID is **NULL**.

##### Parameters

- `in_connection_id` **BIGINT UNSIGNED**: The ID of the connection for which to return the thread ID. This is a connection ID as given in the `PROCESSLIST_ID` column of the Performance Schema `threads` table or the `Id` column of `SHOW PROCESSLIST` output.

##### Return Value

A **BIGINT UNSIGNED** value.

##### Example

```
mysql> SELECT sys.ps_thread_id(260);
+-----+
| sys.ps_thread_id(260) |
+-----+
| 285                   |
+-----+
```

#### 26.4.5.16 The ps\_thread\_stack() Function

Returns a JSON formatted stack of all statements, stages, and events within the Performance Schema for a given thread ID.

### Parameters

- `in_thread_id` **BIGINT**: The ID of the thread to trace. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.
- `in_verbose` **BOOLEAN**: Whether to include `file:lineno` information in the events.

### Return Value

A **LONGTEXT CHARACTER SET latin1** value.

### Example

```
mysql> SELECT sys.ps_thread_stack(37, FALSE) AS thread_stack\G
***** 1. row *****
thread_stack: {"rankdir": "LR", "nodesep": "0.10",
"stack_created": "2014-02-19 13:39:03", "mysql_version": "5.7.3-m13",
"mysql_user": "root@localhost", "events": [{"nesting_event_id": "0",
"event_id": "10", "timer_wait": 256.35, "event_info": "sql/select",
"wait_info": "select @@version_comment limit 1\nerrors: 0\nwarnings: 0\nlock time:
...
```

## 26.4.5.17 The `ps_thread_trx_info()` Function

Returns a JSON object containing information about a given thread. The information includes the current transaction, and the statements it has already executed, derived from the Performance Schema `events_transactions_current` and `events_statements_history` tables. (The consumers for those tables must be enabled to obtain full data in the JSON object.)

If the output exceeds the truncation length (65535 by default), a JSON error object is returned, such as:

```
{ "error": "Trx info truncated: Row 6 was cut by GROUP_CONCAT()" }
```

Similar error objects are returned for other warnings and exceptions raised during function execution.

This function was added in MySQL 5.7.9.

### Parameters

- `in_thread_id` **BIGINT UNSIGNED**: The thread ID for which to return transaction information. The value should match the `THREAD_ID` column from some Performance Schema `threads` table row.

### Configuration Options

`ps_thread_trx_info()` operation can be modified using the following configuration options or their corresponding user-defined variables (see [Section 26.4.2.1, “The sys\\_config Table”](#)):

- `ps_thread_trx_info.max_length`, `@sys.ps_thread_trx_info.max_length`

The maximum length of the output. The default is 65535.

### Return Value

A **LONGTEXT** value.

### Example

```
mysql> SELECT sys.ps_thread_trx_info(48)\G
***** 1. row *****
```

```

sys.ps_thread_trx_info(48): [
{
  "time": "790.70 us",
  "state": "COMMITTED",
  "mode": "READ WRITE",
  "autocommitted": "NO",
  "gtid": "AUTOMATIC",
  "isolation": "REPEATABLE READ",
  "statements_executed": [
    {
      "sql_text": "INSERT INTO info VALUES (1, \'foo\')",
      "time": "471.02 us",
      "schema": "trx",
      "rows_examined": 0,
      "rows_affected": 1,
      "rows_sent": 0,
      "tmp_tables": 0,
      "tmp_disk_tables": 0,
      "sort_rows": 0,
      "sort_merge_passes": 0
    },
    {
      "sql_text": "COMMIT",
      "time": "254.42 us",
      "schema": "trx",
      "rows_examined": 0,
      "rows_affected": 0,
      "rows_sent": 0,
      "tmp_tables": 0,
      "tmp_disk_tables": 0,
      "sort_rows": 0,
      "sort_merge_passes": 0
    }
  ]
},
{
  "time": "426.20 us",
  "state": "COMMITTED",
  "mode": "READ WRITE",
  "autocommitted": "NO",
  "gtid": "AUTOMATIC",
  "isolation": "REPEATABLE READ",
  "statements_executed": [
    {
      "sql_text": "INSERT INTO info VALUES (2, \'bar\')",
      "time": "107.33 us",
      "schema": "trx",
      "rows_examined": 0,
      "rows_affected": 1,
      "rows_sent": 0,
      "tmp_tables": 0,
      "tmp_disk_tables": 0,

```

### 26.4.5.18 The quote\_identifier() Function

Given a string argument, this function produces a quoted identifier suitable for inclusion in SQL statements. This is useful when a value to be used as an identifier is a reserved word or contains backtick ( ` ) characters. It was added in MySQL 5.7.14.

## Parameters

`in_identifier TEXT`: The identifier to quote.

## Return Value

A `TEXT` value.

## Example

```
mysql> SELECT sys.quote_identifier('plain');
+-----+
| sys.quote_identifier('plain') |
+-----+
| `plain`                       |
+-----+
mysql> SELECT sys.quote_identifier('trick`ier');
+-----+
| sys.quote_identifier('trick`ier') |
+-----+
| `trick`ier`                     |
+-----+
mysql> SELECT sys.quote_identifier('integer');
+-----+
| sys.quote_identifier('integer') |
+-----+
| `integer`                      |
+-----+
```

### 26.4.5.19 The sys\_get\_config() Function

Given a configuration option name, returns the option value from the `sys_config` table, or the provided default value (which may be `NULL`) if the option does not exist in the table.

If `sys_get_config()` returns the default value and that value is `NULL`, it is expected that the caller is able to handle `NULL` for the given configuration option.

By convention, routines that call `sys_get_config()` first check whether the corresponding user-defined variable exists and is non-`NULL`. If so, the routine uses the variable value without reading the `sys_config` table. If the variable does not exist or is `NULL`, the routine reads the option value from the table and sets the user-defined variable to that value. For more information about the relationship between configuration options and their corresponding user-defined variables, see [Section 26.4.2.1, “The sys\\_config Table”](#).

If you want to check whether the configuration option has already been set and, if not, use the return value of `sys_get_config()`, you can use `IFNULL(...)` (see example later). However, this should not be done inside a loop (for example, for each row in a result set) because for repeated calls where the assignment is needed only in the first iteration, using `IFNULL(...)` is expected to be significantly slower than using an `IF (...) THEN ... END IF;` block (see example later).

## Parameters

- `in_variable_name VARCHAR(128)`: The name of the configuration option for which to return the value.
- `in_default_value VARCHAR(128)`: The default value to return if the configuration option is not found in the `sys_config` table.

## Return Value

A `VARCHAR(128)` value.

## Example

Get a configuration value from the `sys_config` table, falling back to 128 as the default if the option is not present in the table:

```
mysql> SELECT sys.sys_get_config('statement_truncate_len', 128) AS Value;
+-----+
| Value |
+-----+
| 64    |
+-----+
```

One-liner example: Check whether the option is already set; if not, assign the `IFNULL(...)` result (using the value from the `sys_config` table):

```
mysql> SET @sys.statement_truncate_len =
        IFNULL(@sys.statement_truncate_len,
              sys.sys_get_config('statement_truncate_len', 64));
```

`IF (...)` THEN ... `END IF`; block example: Check whether the option is already set; if not, assign the value from the `sys_config` table:

```
IF (@sys.statement_truncate_len IS NULL) THEN
  SET @sys.statement_truncate_len = sys.sys_get_config('statement_truncate_len', 64);
END IF;
```

### 26.4.5.20 The `version_major()` Function

This function returns the major version of the MySQL server. It was added in MySQL 5.7.9.

## Parameters

None.

## Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_major();
+-----+-----+
| VERSION() | sys.version_major() |
+-----+-----+
| 5.7.24-debug-log | 5 |
+-----+-----+
```

### 26.4.5.21 The `version_minor()` Function

This function returns the minor version of the MySQL server. It was added in MySQL 5.7.9.

## Parameters

None.

## Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_minor();
+-----+-----+
| VERSION() | sys.version_minor() |
+-----+-----+
| 5.7.24-debug-log | 7 |
+-----+-----+
```

### 26.4.5.22 The version\_patch() Function

This function returns the patch release version of the MySQL server. It was added in MySQL 5.7.9.

#### Parameters

None.

#### Return Value

A `TINYINT UNSIGNED` value.

## Example

```
mysql> SELECT VERSION(), sys.version_patch();
+-----+-----+
| VERSION() | sys.version_patch() |
+-----+-----+
| 5.7.24-debug-log | 24 |
+-----+-----+
```

27.14 MySQL Eiffel Wrapper .....	4148

MySQL Connectors provide connectivity to the MySQL server for client programs. APIs provide low-level access to the MySQL protocol and MySQL resources. Both Connectors and the APIs enable you to connect and execute MySQL statements from another language or environment, including ODBC, Java (JDBC), Perl, Python, PHP, Ruby, and native C and embedded MySQL instances.

### MySQL Connectors

Oracle develops a number of connectors:

- [Connector/C](#) is a standalone replacement for the MySQL Client Library (`libmysqlclient`), to be used for C applications.
- [Connector/C++](#) enables C++ applications to connect to MySQL.
- [Connector/J](#) provides driver support for connecting to MySQL from Java applications using the standard Java Database Connectivity (JDBC) API.
- [Connector/NET](#) enables developers to create .NET applications that connect to MySQL. Connector/NET implements a fully functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that use Connector/NET can be written in any supported .NET language.

[MySQL for Visual Studio](#) works with Connector/NET and Microsoft Visual Studio 2012, 2013, 2015, and 2017. MySQL for Visual Studio provides access to MySQL objects and data from Visual Studio. As a Visual Studio package, it integrates directly into Server Explorer providing the ability to create new connections and work with MySQL database objects.

- [Connector/ODBC](#) provides driver support for connecting to MySQL using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix, and OS X platforms.
- [Connector/Python](#) provides driver support for connecting to MySQL from Python applications using an API that is compliant with the [Python DB API version 2.0](#). No additional Python modules or MySQL client libraries are required.

## The MySQL C API

For direct access to using MySQL natively within a C application, there are two methods:

- The [C API](#) provides low-level access to the MySQL client/server protocol through the `libmysqlclient` client library. This is the primary method used to connect to an instance of the MySQL server, and is used both by MySQL command-line clients and many of the MySQL Connectors and third-party APIs detailed here.

`libmysqlclient` is included in MySQL distributions and in Connector/C distributions.

- `libmysqld` is an embedded MySQL server library that enables you to embed an instance of the MySQL server into your C applications.

`libmysqld` is included in MySQL distributions, but not in Connector/C distributions.

### Note

The `libmysqld` embedded server library is deprecated as of MySQL 5.7.19 and will be removed in MySQL 8.0.

See also [Section 27.8.1, “MySQL C API Implementations”](#).

To access MySQL from a C application, or to build an interface to MySQL for a language not supported by the Connectors or APIs in this chapter, the [C API](#) is where to start. A number of programmer's utilities are available to help with the process; see [Section 4.7, “MySQL Program Development Utilities”](#).

## Third-Party MySQL APIs

The remaining APIs described in this chapter provide an interface to MySQL from specific application languages. These third-party solutions are not developed or supported by Oracle. Basic information on their usage and abilities is provided here for reference purposes only.

All the third-party language APIs are developed using one of two methods, using `libmysqlclient` or by implementing a *native driver*. The two solutions offer different benefits:

- Using [\*libmysqlclient\*](#) offers complete compatibility with MySQL because it uses the same libraries as the MySQL client applications. However, the feature set is limited to the implementation and interfaces exposed through [\*libmysqlclient\*](#) and the performance may be lower as data is copied between the native language, and the MySQL API components.
- *Native drivers* are an implementation of the MySQL network protocol entirely within the host language or environment. Native drivers are fast, as there is less copying of data between components, and they can offer advanced functionality not available through the standard MySQL API. Native drivers are also easier for end users to build and deploy because no copy of the MySQL client libraries is needed to build the native driver components.

Table 27.1, “MySQL APIs and Interfaces” lists many of the libraries and interfaces available for MySQL.

**Table 27.1 MySQL APIs and Interfaces**

Environment	API	Type	Notes
Ada	GNU Ada MySQL Bindings	<a href="#"><i>libmysqlclient</i></a>	See <a href="#">MySQL Bindings for GNU Ada</a>

## 27.1 MySQL Connector/C

The MySQL Connector/C manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/C Developer Guide](#)
- Release notes: [MySQL Connector/C Release Notes](#)

## 27.2 MySQL Connector/C++

The MySQL Connector/C++ manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/C++ 8.0 Developer Guide](#)
- Release notes: [MySQL Connector/C++ Release Notes](#)

## 27.3 MySQL Connector/J

The MySQL Connector/J manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/J Developer Guide](#)
- Release notes: [MySQL Connector/J Release Notes](#)

## 27.4 MySQL Connector/NET

The MySQL Connector/NET manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/NET Developer Guide](#)
- Release notes: [MySQL Connector/NET Release Notes](#)

## 27.5 MySQL Connector/ODBC

The MySQL Connector/ODBC manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/ODBC Developer Guide](#)
- Release notes: [MySQL Connector/ODBC Release Notes](#)

## 27.6 MySQL Connector/Python

The MySQL Connector/Python manual is published in standalone form, not as part of the MySQL Reference Manual. For information, see these documents:

- Main manual: [MySQL Connector/Python Developer Guide](#)
- Release notes: [MySQL Connector/Python Release Notes](#)

## 27.7 libmysqld, the Embedded MySQL Server Library

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

### Note

The `libmysqld` embedded server library is deprecated as of MySQL 5.7.19 and will be removed in MySQL 8.0.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change a threaded application to use the embedded library, you normally only have to add calls to the following functions.

**Table 27.2 MySQL Embedded Server Library Functions**

Function	When to Call
<code>mysql_library_init()</code>	Call it before any other MySQL function is called, preferably early in the <code>main()</code> function.
<code>mysql_library_end()</code>	Call it before your program exits.
<code>mysql_thread_init()</code>	Call it in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Call it before calling <code>pthread_exit()</code> .

Then, link your code with `libmysqld.a` instead of `libmysqlclient.a`. To ensure binary compatibility between your application and the server library, always compile your application against headers for the same series of MySQL that was used to compile the server library. For example, if `libmysqld` was compiled against MySQL 5.6 headers, do not compile your application against MySQL 5.7 headers, or vice versa.

Because the `mysql_library_xxx()` functions are also included in `libmysqlclient.a`, you can change between the embedded and the client/server version by just linking your application with the right library. See [Section 27.8.7.41](#), “`mysql_library_init()`”.

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default.

### 27.7.1 Compiling Programs with libmysqld

In precompiled binary MySQL distributions that include `libmysqld`, the embedded server library, MySQL builds the library using the appropriate vendor compiler if there is one.

To get a `libmysqld` library if you build MySQL from source yourself, you should configure MySQL with the `-DWITH_EMBEDDED_SERVER=1` option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

When you link your program with `libmysqld`, you must also include the system-specific `pthread` libraries and some libraries that the MySQL server uses. You can get the full list of libraries by executing `mysql_config --libmysqld-libs`.

The correct flags for compiling and linking a threaded program must be used, even if you do not directly call any thread functions in your code.

To compile a C program to include the necessary files to embed the MySQL server library into an executable version of a program, the compiler will need to know where to find various files and need instructions on how to compile the program. The following example shows how a program could be compiled from the command line, assuming that you are using `gcc`, use the GNU C compiler:

```
gcc mysql_test.c -o mysql_test \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Immediately following the `gcc` command is the name of the C program source file. After it, the `-o` option is given to indicate that the file name that follows is the name that the compiler is to give to the output file, the compiled program. The next line of code tells the compiler to obtain the location of the include files and libraries and other settings for the system on which it is compiled. The `mysql_config` command is contained in backticks, not single quotation marks.

On some non-`gcc` platforms, the embedded library depends on C++ runtime libraries and linking against the embedded library might result in missing-symbol errors. To solve this, link using a C++ compiler or explicitly list the required libraries on the link command line.

## 27.7.2 Restrictions When Using the Embedded MySQL Server

The embedded server has the following limitations:

- No user-defined functions (UDFs).
- No stack trace on core dump.
- You cannot set this up as a master or a slave (no replication).
- Very large result sets may be unusable on low memory systems.
- You cannot connect to an embedded server from an outside process with sockets or TCP/IP. However, you can connect to an intermediate application, which in turn can connect to an embedded server on the behalf of a remote client or outside process.
- `InnoDB` is not reentrant in the embedded server and cannot be used for multiple connections, either successively or simultaneously.
- The Event Scheduler is not available. Because of this, the `event_scheduler` system variable is disabled.
- The Performance Schema is not available.
- The embedded server cannot share the same `secure_file_priv` directory with another server. As of MySQL 5.7.8, the default value for this directory can be set at build time with the `INSTALL_SECURE_FILE_PRIV_EMBEDDEDIR` CMake option.

Some of these limitations can be changed by editing the `mysql_embed.h` include file and recompiling MySQL.

## 27.7.3 Options with the Embedded Server

Any options that may be given with the `mysqld` server daemon, may be used with an embedded server library. Server options may be given in an array as an argument to the `mysql_library_init()`, which initializes the server. They also may be given in an option file like `my.cnf`. To specify an option file for a C program, use the `--defaults-file` option as one of the elements of the second argument of the `mysql_library_init()` function. See [Section 27.8.7.41](#), “`mysql_library_init()`”, for more information on the `mysql_library_init()` function.

Using option files can make it easier to switch between a client/server application and one where MySQL is embedded. Put common options under the `[server]` group. These are read by both MySQL versions. Client/server-specific options should go under the `[mysqld]` section. Put options specific to the embedded MySQL server library in the `[embedded]` section. Options specific to applications go under section labeled `[ApplicationName_SERVER]`. See [Section 4.2.6](#), “Using Option Files”.

## 27.7.4 Embedded Server Examples

These two example programs should work without any changes on a Linux or FreeBSD system. For other operating systems, minor changes are needed, mostly with file paths. These examples are designed to give enough details for you to understand the problem, without the clutter that is a necessary part of a real application. The first example is very straightforward. The second example is a little more advanced with some error checking. The first is followed by a command-line entry for compiling the program. The second is followed by a GNUmake file that may be used for compiling instead.

### Example 1

`test1_libmysqld.c`

```
#include <stdio.h>
#include <stdlib.h>
#include <stdarg.h>
#include "mysql.h"

MYSQL *mysql;
MYSQL_RES *results;
MYSQL_ROW record;

static char *server_options[] = \
    { "mysql_test", "--defaults-file=my.cnf", NULL };
int num_elements = (sizeof(server_options) / sizeof(char *)) - 1;

static char *server_groups[] = { "libmysqld_server",
                                "libmysqld_client", NULL };

int main(void)
{
    mysql_library_init(num_elements, server_options, server_groups);
    mysql = mysql_init(NULL);
    mysql_options(mysql, MYSQL_READ_DEFAULT_GROUP, "libmysqld_client");
    mysql_options(mysql, MYSQL_OPT_USE_EMBEDDED_CONNECTION, NULL);

    mysql_real_connect(mysql, NULL, NULL, NULL, "database1", 0, NULL, 0);

    mysql_query(mysql, "SELECT column1, column2 FROM table1");

    results = mysql_store_result(mysql);

    while((record = mysql_fetch_row(results))) {
        printf("%s - %s \n", record[0], record[1]);
    }

    mysql_free_result(results);
    mysql_close(mysql);
    mysql_library_end();

    return 0;
}
```

```
}
```

Here is the command line for compiling the above program:

```
gcc test1_libmysqld.c -o test1_libmysqld \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

## Example 2

To try the example, create an `test2_libmysqld` directory at the same level as the MySQL source directory. Save the `test2_libmysqld.c` source and the `GNUmakefile` in the directory, and run GNU `make` from inside the `test2_libmysqld` directory.

`test2_libmysqld.c`

```
/*
 * A simple example client, using the embedded MySQL server library
 */

#include <mysql.h>
#include <stdarg.h>
#include <stdio.h>
#include <stdlib.h>

MYSQL *db_connect(const char *dbname);
void db_disconnect(MYSQL *db);
void db_do_query(MYSQL *db, const char *query);

const char *server_groups[] = {
    "test2_libmysqld_SERVER", "embedded", "server", NULL
};

int
main(int argc, char **argv)
{
    MYSQL *one, *two;

    /* mysql_library_init() must be called before any other mysql
     * functions.
     *
     * You can use mysql_library_init(0, NULL, NULL), and it
     * initializes the server using groups = {
     *     "server", "embedded", NULL
     * }.
     *
     * In your $HOME/.my.cnf file, you probably want to put:
     *
     * [test2_libmysqld_SERVER]
     * language = /path/to/source/of/mysql/sql/share/english
     *
     * You could, of course, modify argc and argv before passing
     * them to this function. Or you could create new ones in any
     * way you like. But all of the arguments in argv (except for
     * argv[0], which is the program name) should be valid options
     * for the MySQL server.
     *
     * If you link this client against the normal mysqlclient
     * library, this function is just a stub that does nothing.
     */
    mysql_library_init(argc, argv, (char **)server_groups);

    one = db_connect("test");
    two = db_connect(NULL);

    db_do_query(one, "SHOW TABLE STATUS");
    db_do_query(two, "SHOW DATABASES");

    mysql_close(two);
    mysql_close(one);
}
```

```

/* This must be called after all other mysql functions */
mysql_library_end();

exit(EXIT_SUCCESS);
}

static void

## 27.8 MySQL C API

The C API provides low-level access to the MySQL client/server protocol and enables C programs to access database contents. The C API code is distributed with MySQL and implemented in the `libmysqlclient` library. See [Section 27.8.1, “MySQL C API Implementations”](#).

Most other client APIs use the `libmysqlclient` library to communicate with the MySQL server. (Exceptions are Connector/J and Connector/NET.) This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs because they are referenced from the library. For a list of these variables, see [Section 4.1, “Overview of MySQL Programs”](#).

For instructions on building client programs using the C API, see [Section 27.8.4.1, “Building C API Client Programs”](#). For programming with threads, see [Section 27.8.4.3, “Writing C API Threaded Client Programs”](#). To create a standalone application which includes the "server" and "client" in the same program (and does not communicate with an external MySQL server), see [Section 27.7, “libmysqld, the Embedded MySQL Server Library”](#).

#### Note

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for

compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompile might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`). For additional compatibility information, see [Section 27.8.4.4, “Running C API Client Programs”](#).

Clients have a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (16MB by default). Because buffer sizes are increased only as demand warrants, simply increasing the maximum limit does not in itself cause more resources to be used. This size check is mostly a precaution against erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each session's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The default maximum built into the client library is 1GB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter at server startup. See [Section 5.1.1, “Configuring the Server”](#).

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

## 27.8.1 MySQL C API Implementations

The MySQL C API is a C-based API that client applications written in C can use to communicate with MySQL Server. Client programs refer to C API header files at compile time and link to a C API library file at link time. The library comes in two versions, depending on how the application is intended to communicate with the server:

- `libmysqlclient`: The client version of the library, used for applications that communicate over a network connection as a client of a standalone server process.
- `libmysqld`: The embedded server version of the library, used for applications intended to include an embedded MySQL server within the application itself. The application communicates with its own private server instance.

### Note

The `libmysqld` embedded server library is deprecated as of MySQL 5.7.19 and will be removed in MySQL 8.0.

Both libraries have the same interface. In terms of C API calls, an application communicates with a standalone server the same way it communicates with an embedded server. A given client can be built to communicate with a standalone or embedded server, depending on whether it is linked against `libmysqlclient` or `libmysqld` at build time.

There are two ways to obtain the C API header and library files required to build C API client programs:

- Install a MySQL Server distribution. Server distributions include both `libmysqlclient` and `libmysqld`.
- Install a Connector/C distribution. Connector/C distributions include only `libmysqlclient`. They do not include `libmysqld`.

For both MySQL Server and Connector/C, you can install a binary distribution that contains the C API files pre-built, or you can use a source distribution and build the C API files yourself.

Normally, you install either a MySQL Server distribution or a Connector/C distribution, but not both. For information about issues involved with simultaneous MySQL Server and Connector/C installations, see [Section 27.8.2, “Simultaneous MySQL Server and Connector/C Installations”](#).

The names of the library files to use when linking C API client applications depend on the library type and platform for which a distribution is built:

- On Unix (and Unix-like) systems, the static library is `libmysqlclient.a`. The dynamic library is `libmysqlclient.so` on most Unix systems and `libmysqlclient.dylib` on OS X.

For distributions that include embedded server libraries, the corresponding library names begin with `libmysqld` rather than `libmysqlclient`.

- On Windows, the static library is `mysqlclient.lib` and the dynamic library is `libmysql.dll`. Windows distributions also include `libmysql.lib`, a static import library needed for using the dynamic library.

For distributions that include embedded server libraries, the corresponding library names are `mysqlserver.lib`, `libmysqld.dll`, and `libmysqld.lib`.

Windows distributions also include a set of debug libraries. These have the same names as the nondebug libraries, but are located in the `lib/debug` library. You must use the debug libraries when compiling clients built using the debug C runtime.

On Unix, you may also see libraries that include `_r` in the names. Before MySQL 5.5, these were built as thread-safe (re-entrant) libraries separately from the non-`_r` libraries. As of 5.5, both libraries are the same and the `_r` names are symbolic links to the corresponding non-`_r` names. There is no need to use the `_r` libraries. For example, if you use `mysql_config` to obtain linker flags, you can use `mysql_config --libs` in all cases, even for threaded clients. There is no need to use `mysql_config --libs_r`.

## 27.8.2 Simultaneous MySQL Server and Connector/C Installations

MySQL Server and Connector/C installation packages both provide the files needed to build and run MySQL C API client programs. This section discusses when it is possible to install both products on the same system. For some packaging formats, this is possible without conflict. For others, both products cannot be installed at the same time.

This discussion assumes the use of similar package types for both products (for example, RPM packages for both products). It does not try to describe coexistence between packaging types (for example, use of RPM packages for one product and a `tar` file package for the other). Nor does it describe coexistence of packages provided by Oracle and those provided by third-party vendors.

If you install both products, it may be necessary to adjust your development tools or runtime environment to choose one set of header files and libraries over the other. See [Section 27.8.4.1, “Building C API Client Programs”](#), and [Section 27.8.4.4, “Running C API Client Programs”](#).

`tar` and Zip file packages install under the directory into which you unpack them. For example, you can unpack MySQL Server and Connector/C `tar` packages under `/usr/local` and they will unpack into distinct directory names without conflict.

Windows MSI installers use their own installation directory, so MySQL Server and Connector/C installers do not conflict.

OS X DMG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/usr/local/mysql-5.6.11-osx10.7-x86_64/  
/usr/local/mysql-connector-c-6.1.0-osx10.7-x86/
```

Solaris PKG packages install under the same parent directory but in a different subdirectory, so there is no conflict. For example:

```
/opt/mysql/mysql  
/opt/mysql/connector-c
```

The Solaris Connector/C installer does not create any symlinks from system directories such as `/usr/bin` or `/usr/lib` into the installation directory. That must be done manually if desired after installation.

For RPM installations, there are several types of RPM packages. MySQL Server `shared` and `devel` RPM packages are similar to the corresponding Connector/C RPM packages. These RPM package types cannot coexist because the MySQL Server and Connector/C RPM packages use the same installation locations for the client library-related files. This means the following conditions hold:

- If MySQL Server `shared` and `devel` RPM packages are installed, they provide the C API headers and libraries, and there is no need to install the Connector/C RPM packages. To install the Connector/C packages anyway, you must first remove the corresponding MySQL Server packages.
- To install MySQL Server RPM packages if you already have Connector/C RPM packages installed, you must first remove the Connector/C RPM packages.

MySQL Server RPM packages other than `shared` and `devel` do not conflict with Connector/C packages and can be installed if Connector/C is installed. This includes the main server RPM that includes the `mysqld` server itself.

## 27.8.3 Example C API Client Programs

Many of the clients in MySQL source distributions are written in C, such as `mysql`, `mysqladmin`, and `mysqlshow`. If you are looking for examples that demonstrate how to use the C API, take a look at these clients: Obtain a source distribution and look in its `client` directory. See [Section 2.1.2, “How to Get MySQL”](#).

## 27.8.4 Building and Running C API Client Programs

The following sections provide information on building client programs that use the C API. Topics include compiling and linking clients, writing threaded clients, and troubleshooting runtime problems.

### 27.8.4.1 Building C API Client Programs

This section provides guidelines for compiling C programs that use the MySQL C API.

#### Compiling MySQL Clients on Unix

The examples here use `gcc` as the compiler. A different compiler might be appropriate on some systems (for example, `clang` on OS X or FreeBSD, or Sun Studio on Solaris). Adjust the examples as necessary.

You may need to specify an `-I` option when you compile client programs that use MySQL header files, so that the compiler can find them. For example, if the header files are installed in `/usr/local/mysql/include`, use this option in the compile command:

```
-I/usr/local/mysql/include
```

MySQL clients must be linked using the `-lmysqlclient` option in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use these options in the link command:

```
-L/usr/local/mysql/lib -lmysqlclient
```

The path names may differ on your system. Adjust the `-I` and `-L` options as necessary.

To make it simpler to compile MySQL programs on Unix, use the `mysql_config` script. See [Section 4.7.1, “mysql\\_config — Display Options for Compiling Clients”](#).

`mysql_config` displays the options needed for compiling or linking:

```
shell> mysql_config --cflags
shell> mysql_config --libs
```

You can run those commands to get the proper options and add them manually to compilation or link commands. Alternatively, include the output from `mysql_config` directly within command lines using backticks:

```
shell> gcc -c `mysql_config --cflags` progname.c
shell> gcc -o progname progname.o `mysql_config --libs`
```

On Unix, linking uses dynamic libraries by default. To link to the static client library instead, add its path name to the link command. For example, if the library is located in `/usr/local/mysql/lib`, link like this:

```
shell> gcc -o progname progname.o /usr/local/mysql/lib/libmysqlclient.a
```

Or use `mysql_config` to provide the library name:

```
shell> gcc -o progname progname.o `mysql_config --variable=pkglibdir`/libmysqlclient.a
```

`mysql_config` does not currently provide a way to list all libraries needed for static linking, so it might be necessary to name additional libraries on the link command (for example, `-lnsl -lsocket` on Solaris). To get an idea which libraries to add, use `mysql_config --libs` and `ldd libmysqlclient.so` (or `otool -L libmysqlclient.dylib` on OS X).

`pkg-config` can be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient

mysql_config --libs
pkg-config --libs mysqlclient
```

To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

For more information, see [Section 27.8.4.2, “Building C API Client Programs Using pkg-config”](#).

## Compiling MySQL Clients on Microsoft Windows

To specify header and library file locations, use the facilities provided by your development environment.

To build C API clients on Windows, you must link in the C client library, as well as the Windows `ws2_32` sockets library and `Secur32` security library.

You link your code with either the dynamic or static C client library. On Windows, the static library is named `mysqlclient.lib` and the dynamic library is named `libmysql.dll`. In addition, the `libmysql.lib` static import library is needed for using the dynamic library. If the static C client library is used, the client application must be compiled with the same version of Visual Studio used to compile the C client library (which is Visual Studio 2013 for the static C client library built by Oracle).

### Note

The [MySQL Connector/C](#) is a standalone, drop-in replacement of the MySQL C client libraries that come with the MySQL server distribution. The Oracle-built

**MySQL Connector/C** contains currently two versions of the static client library, one built with Visual Studio 2013 and the other one with Visual Studio 2015; use the one that matches the Visual Studio version you use to compile your application.

When using the Oracle-built MySQL C client library (or MySQL Connector/C), following these rules when it comes to linking the C runtime for your client application:

- For the Community version of the MySQL C client library (or the Community version of MySQL Connector/C):
  - *For version 5.7.17 and before* (or MySQL Connector/C Community 6.1.9 and before):
    - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
    - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).
  - *For version 5.7.18 and later* (or MySQL Connector/C Community 6.1.10 and later): Always link dynamically to the C runtime (use the `/MD` compiler option), whether you are linking to the static or dynamic C client library. Also, target hosts running the client application need to have the [Visual C++ Redistributable for Visual Studio 2013](#) installed if you are using the C client libraries, or the [Visual C++ Redistributable for Visual Studio 2015](#) installed if you are using MySQL Connector/C.
- For the Commercial version of the MySQL C client library (or the Commercial version of MySQL Connector/C):
  - If linking to the static C client library, link statically to the C runtime (use the `/MT` compiler option).
  - If linking to the dynamic C client library, link either statically or dynamically to the C runtime (use either `/MT` or `/MD` compiler option).

In general, when linking to a static MySQL C client library, the client library and the client application must use the same compiler option when it comes to linking the C runtime—that is, if your C client library is compiled with the `/MT` option, your client application should also be compiled with the `/MT` option, and so on (see [the MSDN page describing the C library linking options](#) for more details). Follow this rule when you are building your own static MySQL C client library (or MySQL Connector/C) from source and linking your client application to it.

#### Note

*Debug Mode:* Because of the above-mentioned rule, you cannot build your application in debug mode (with the `/MTd` or `/MDd` compiler option) and link it to the static C client library built by Oracle, which is *not* built with the debug options; instead, you will have to build the static client library from source with the debug options.

## Troubleshooting Problems Linking to the MySQL Client Library

The MySQL client library includes SSL support built in. It is unnecessary to specify either `-lssl` or `-lcrypto` at link time. Doing so may in fact result in problems at runtime.

If the linker cannot find the MySQL client library, you might get undefined-reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the path name of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well. You can include `mysql_config` output directly in your compile or link command using backticks. For example:

```
shell> gcc -o progname progname.o `mysql_config --libs`
```

If an error occurs at link time that the `floor` symbol is undefined, link to the math library by adding `-lm` to the end of the compile/link line. Similarly, if you get undefined-reference errors for other functions that should exist on your system, such as `connect()`, check the manual page for the function in question to determine which libraries you should add to the link command.

If you get undefined-reference errors such as the following for functions that do not exist on your system, it usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

In this case, you should download the latest MySQL or Connector/C source distribution and compile the MySQL client library yourself. See [Section 2.9, “Installing MySQL from Source”](#), and [MySQL Connector/C Developer Guide](#).

### 27.8.4.2 Building C API Client Programs Using pkg-config

MySQL distributions contain a `mysqlclient.pc` file that provides information about MySQL configuration for use by the `pkg-config` command. This enables `pkg-config` to be used as an alternative to `mysql_config` for obtaining information such as compiler flags or link libraries required to compile MySQL applications. For example, the following pairs of commands are equivalent:

```
mysql_config --cflags
pkg-config --cflags mysqlclient

mysql_config --libs
pkg-config --libs mysqlclient
```

The last `pkg-config` command produces flags for dynamic linking. To produce flags for static linking, use this command:

```
pkg-config --static --libs mysqlclient
```

On some platforms, the output with and without `--static` might be the same.

#### Note

If `pkg-config` does not find MySQL information, it might be necessary to set the `PKG_CONFIG_PATH` environment variable to the directory in which the `mysqlclient.pc` file is located, which by default is usually the `pkgconfig` directory under the MySQL library directory. For example (adjust the location appropriately):

```
export PKG_CONFIG_PATH=/usr/local/mysql/lib/pkgconfig # sh, bash, ...
setenv PKG_CONFIG_PATH /usr/local/mysql/lib/pkgconfig # csh, tcsh, ...
```

The `mysqlconfig.pc` installation location can be controlled using the `INSTALL_PKGCONFIGDIR` CMake option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

The `--variable` option takes a configuration variable name and displays the variable value:

```
pkg-config --variable=prefix mysqlclient      # installation prefix directory
pkg-config --variable=includedir mysqlclient  # header file directory
pkg-config --variable=libdir mysqlclient      # library directory
```

To see which variable values `pkg-config` can display using the `--variable` option, use this command:

```
pkg-config --print-variables mysqlclient
```

You can use `pkg-config` within a command line using backticks to include the output that it produces for particular options. For example, to compile and link a MySQL client program, use `pkg-config` as follows:

```
gcc -c `pkg-config --cflags mysqlclient` progname.c
gcc -o progname progname.o `pkg-config --libs mysqlclient`
```

### 27.8.4.3 Writing C API Threaded Client Programs

The client library is almost thread-safe. The biggest problem is that the subroutines in `sql/net_serv.cc` that read from sockets are not interrupt-safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, socket handling should be thread-safe.

To avoid aborting the program when a connection terminates, MySQL blocks `SIGPIPE` on the first call to `mysql_library_init()`, `mysql_init()`, or `mysql_connect()`. To use your own `SIGPIPE` handler, first call `mysql_library_init()`, then install your handler.

If “undefined symbol” errors occur when linking against the `libmysqlclient` client library, in most cases this is because you have not included the thread libraries on the link/compile command.

The client library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Multiple threads cannot send a query to the MySQL server at the same time on the same connection. In particular, you must ensure that between calls to `mysql_query()` and `mysql_store_result()` in one thread, no other thread uses the same connection. You must have a mutex lock around your pair of `mysql_query()` and `mysql_store_result()` calls. After `mysql_store_result()` returns, the lock can be released and other threads may query the same connection.

If you use POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- To use `mysql_use_result()`, you must ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.

You need to know the following if you have a thread that did not create the connection to the MySQL database but is calling MySQL functions:

When you call `mysql_init()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things). If you call a MySQL function before the thread has called

`mysql_init()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later. To avoid problems, you must do the following:

1. Call `mysql_library_init()` before any other MySQL functions. It is not thread-safe, so call it before threads are created, or protect the call with a mutex.
2. Arrange for `mysql_thread_init()` to be called early in the thread handler before calling any MySQL function. If you call `mysql_init()`, it will call `mysql_thread_init()` for you.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

The preceding notes regarding `mysql_init()` also apply to `mysql_connect()`, which calls `mysql_init()`.

#### 27.8.4.4 Running C API Client Programs

If, after an upgrade, you experience problems with compiled client programs, such as `Commands out of sync` or unexpected core dumps, the programs were probably compiled using old header or library files. In this case, check the date of the `mysql.h` file and `libmysqlclient.a` library used for compilation to verify that they are from the new MySQL distribution. If not, recompile the programs with the new headers and libraries. Recompilation might also be necessary for programs compiled against the shared client library if the library major version number has changed (for example, from `libmysqlclient.so.17` to `libmysqlclient.so.18`).

The major client library version determines compatibility. (For example, for `libmysqlclient.so.18.1.0`, the major version is 18.) For this reason, the libraries shipped with newer versions of MySQL are drop-in replacements for older versions that have the same major number. As long as the major library version is the same, you can upgrade the library and old applications should continue to work with it.

Undefined-reference errors might occur at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `libmysqlclient` library cannot be found, it means that your system cannot find the shared `libmysqlclient.so` library. The solution to this problem is to tell your system to search for shared libraries in the directory where that library is located. Use whichever of the following methods is appropriate for your system:

- Add the path of the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` or `LD_LIBRARY` environment variable.
- On OS X, add the path of the directory where `libmysqlclient.dylib` is located to the `DYLD_LIBRARY_PATH` environment variable.
- Copy the shared-library files (such as `libmysqlclient.so`) to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`. Be sure to copy all related files. A shared library might exist under several names, using symlinks to provide the alternate names.

If the application is linked to the embedded server library, runtime error messages will indicate the `libmysqld` rather than `libmysqlclient` library, but the solution to the problem is the same as just described.

#### 27.8.4.5 C API Server and Client Library Versions

The string and numeric forms of the MySQL server version are available at compile time as the values of the `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_server_info()` and `mysql_get_server_version()` functions.

The MySQL client library version depends on the type of distribution that provides the library:

- For MySQL distributions, the client library version is the MySQL version. The string and numeric forms of this version are available at compile time as the values of the

`MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

The `LIBMYSQL_VERSION` and `LIBMYSQL_VERSION_ID` macros have the same values as `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` and the two sets of macros can be used interchangeably.

- For Connector/C distributions, the client library version is the Connector/C version. The string and numeric forms of this version are available at compile time as the values of the `LIBMYSQL_VERSION` and `LIBMYSQL_VERSION_ID` macros, and at runtime as the values of the `mysql_get_client_info()` and `mysql_get_client_version()` functions.

The `MYSQL_SERVER_VERSION` and `MYSQL_VERSION_ID` macros indicate the string and numeric forms of the MySQL version on which the Connector/C distribution is based.

## 27.8.5 C API Data Structures

This section describes C API data structures other than those used for prepared statements. For information about the latter, see [Section 27.8.9, “C API Prepared Statement Data Structures”](#).

- `MYSQL`

This structure represents handler for one database connection. It is used for almost all MySQL functions. Do not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- `MYSQL_RES`

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- `MYSQL_ROW`

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- `MYSQL_FIELD`

This structure contains metadata: information about a field, such as the field's name, type, and size. Its members are described in more detail later in this section. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- `MYSQL_FIELD_OFFSET`

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- `my_ulonglong`

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to 1.84e19.

Some functions that return a row count using this type return -1 as an unsigned value to indicate an error or exceptional condition. You can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n",
        (unsigned long) mysql_num_rows(result));
```

- `my_bool`

A boolean type, for values that are true (nonzero) or false (zero).

The `MYSQL_FIELD` structure contains the members described in the following list. The definitions apply primarily for columns of result sets such as those produced by `SELECT` statements. `MYSQL_FIELD` structures are also used to provide metadata for `OUT` and `INOUT` parameters returned from stored procedures executed using prepared `CALL` statements. For such parameters, some of the structure members have a meaning different from the meaning for column values.

- `char * name`

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias. For a procedure parameter, the parameter name.

- `char * org_name`

The name of the field, as a null-terminated string. Aliases are ignored. For expressions, the value is an empty string. For a procedure parameter, the parameter name.

- `char * table`

The name of the table containing this field, if it is not a calculated field. For calculated fields, the `table` value is an empty string. If the column is selected from a view, `table` names the view. If the table or view was given an alias with an `AS` clause, the value of `table` is the alias. For a `UNION`, the value is the empty string. For a procedure parameter, the procedure name.

- `char * org_table`

The name of the table, as a null-terminated string. Aliases are ignored. If the column is selected from a view, `org_table` names the view. If the column is selected from a derived table, `org_table` names the base table. If a derived table wraps a view, `org_table` still names the base table. If the column is an expression, `org_table` is the empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the value is the procedure name.

- `char * db`

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. For a `UNION`, the value is the empty string. For a procedure parameter, the name of the database containing the procedure.

- `char * catalog`

The catalog name. This value is always `"def"`.

- `char * def`

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`

The width of the field. This corresponds to the display length, in bytes.

The server determines the `length` value before it generates the result set, so this is the minimum length required for a data type capable of holding the largest possible value from the result column, without knowing in advance the actual values that will be produced by the query for the result set.

- `unsigned long max_length`

The maximum width of the field for the result set (the length in bytes of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

The value of `max_length` is the length of the string representation of the values in the result set. For example, if you retrieve a `FLOAT` column and the “widest” value is `-12.345`, `max_length` is 7 (the length of `'-12.345'`).

If you are using prepared statements, `max_length` is not set by default because for the binary protocol the lengths of the values depend on the types of the values in the result set. (See [Section 27.8.9, “C API Prepared Statement Data Structures”](#).) If you want the `max_length` values anyway, enable the `STMT_ATTR_UPDATE_MAX_LENGTH` option with `mysql_stmt_attr_set()` and the lengths will be set when you call `mysql_stmt_store_result()`. (See [Section 27.8.11.3, “mysql\\_stmt\\_attr\\_set\(\)”](#), and [Section 27.8.11.28, “mysql\\_stmt\\_store\\_result\(\)”](#).)

- `unsigned int name_length`

The length of `name`.

- `unsigned int org_name_length`

The length of `org_name`.

- `unsigned int table_length`

The length of `table`.

- `unsigned int org_table_length`

The length of `org_table`.

- `unsigned int db_length`

The length of `db`.

- `unsigned int catalog_length`

The length of `catalog`.

- `unsigned int def_length`

The length of `def`.

- `unsigned int flags`

Bit-flags that describe the field. The `flags` value may have zero or more of the bits set that are shown in the following table.

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field cannot be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a nonunique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute

Flag Value	Flag Description
ENUM_FLAG	Field is an <a href="#">ENUM</a>
SET_FLAG	Field is a <a href="#">SET</a>
BLOB_FLAG	Field is a <a href="#">BLOB</a> or <a href="#">TEXT</a> (deprecated)
TIMESTAMP_FLAG	Field is a <a href="#">TIMESTAMP</a> (deprecated)
NUM_FLAG	Field is numeric; see additional notes following table
NO_DEFAULT_VALUE_FLAG	Field has no default value; see additional notes following table

Some of these flags indicate data type information and are superseded by or used in conjunction with the `MYSQL_TYPE_XXX` value in the `field->type` member described later:

- To check for [BLOB](#) or [TIMESTAMP](#) values, check whether `type` is `MYSQL_TYPE_BLOB` or `MYSQL_TYPE_TIMESTAMP`. (The `BLOB_FLAG` and `TIMESTAMP_FLAG` flags are unneeded.)
- [ENUM](#) and [SET](#) values are returned as strings. For these, check that the `type` value is `MYSQL_TYPE_STRING` and that the `ENUM_FLAG` or `SET_FLAG` flag is set in the `flags` value.

`NUM_FLAG` indicates that a column is numeric. This includes columns with a type of `MYSQL_TYPE_DECIMAL`, `MYSQL_TYPE_NEWDECIMAL`, `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, `MYSQL_TYPE_FLOAT`, `MYSQL_TYPE_DOUBLE`, `MYSQL_TYPE_NULL`, `MYSQL_TYPE_LONGLONG`, `MYSQL_TYPE_INT24`, and `MYSQL_TYPE_YEAR`.

`NO_DEFAULT_VALUE_FLAG` indicates that a column has no [DEFAULT](#) clause in its definition. This does not apply to [NULL](#) columns (because such columns have a default of [NULL](#)), or to [AUTO\\_INCREMENT](#) columns (which have an implied default value).

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field cannot be null\n");
```

You may use the convenience macros shown in the following table to determine the boolean status of the `flags` value.

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <a href="#">NOT NULL</a>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <a href="#">BLOB</a> or <a href="#">TEXT</a> (deprecated; test <code>field-&gt;type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields, and the fractional seconds precision for temporal fields.

- `unsigned int charsetnr`

An ID number that indicates the character set/collation pair for the field.

Normally, character values in result sets are converted to the character set indicated by the `character_set_results` system variable. In this case, `charsetnr` corresponds to the character set indicated by that variable. Character set conversion can be suppressed by setting `character_set_results` to `NULL`. In this case, `charsetnr` corresponds to the character set of the original table column or expression. See also [Section 10.4, "Connection Character Sets and Collations"](#).

To distinguish between binary and nonbinary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

`charsetnr` values are the same as those displayed in the `Id` column of the `SHOW COLLATION` statement or the `ID` column of the `INFORMATION_SCHEMA.COLLATIONS` table. You can use those information sources to see which character set and collation specific `charsetnr` values indicate:

```
mysql> SHOW COLLATION WHERE Id = 63;
+-----+-----+-----+-----+-----+-----+
| Collation | Charset | Id | Default | Compiled | Sortlen |
+-----+-----+-----+-----+-----+-----+
| binary    | binary  | 63 | Yes     | Yes      | 1       |
+-----+-----+-----+-----+-----+-----+

mysql> SELECT COLLATION_NAME, CHARACTER_SET_NAME
        FROM INFORMATION_SCHEMA.COLLATIONS WHERE ID = 33;
+-----+-----+
| COLLATION_NAME | CHARACTER_SET_NAME |
+-----+-----+
| utf8_general_ci | utf8               |
+-----+-----+
```

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code> field
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code> field
<code>MYSQL_TYPE_LONG</code>	<code>INTEGER</code> field
<code>MYSQL_TYPE_INT24</code>	<code>MEDIUMINT</code> field
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code> field
<code>MYSQL_TYPE_DECIMAL</code>	<code>DECIMAL</code> or <code>NUMERIC</code> field
<code>MYSQL_TYPE_NEWDECIMAL</code>	Precision math <code>DECIMAL</code> or <code>NUMERIC</code>
<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code> field
<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code> or <code>REAL</code> field
<code>MYSQL_TYPE_BIT</code>	<code>BIT</code> field
<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code> field
<code>MYSQL_TYPE_DATE</code>	<code>DATE</code> field
<code>MYSQL_TYPE_TIME</code>	<code>TIME</code> field
<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code> field
<code>MYSQL_TYPE_YEAR</code>	<code>YEAR</code> field
<code>MYSQL_TYPE_STRING</code>	<code>CHAR</code> or <code>BINARY</code> field
<code>MYSQL_TYPE_VAR_STRING</code>	<code>VARCHAR</code> or <code>VARBINARY</code> field
<code>MYSQL_TYPE_BLOB</code>	<code>BLOB</code> or <code>TEXT</code> field (use <code>max_length</code> to determine the maximum length)
<code>MYSQL_TYPE_SET</code>	<code>SET</code> field
<code>MYSQL_TYPE_ENUM</code>	<code>ENUM</code> field
<code>MYSQL_TYPE_GEOMETRY</code>	Spatial field

Type Value	Type Description
<code>MYSQL_TYPE_NULL</code>	NULL-type field

The `MYSQL_TYPE_TIME2`, `MYSQL_TYPE_DATETIME2`, and `MYSQL_TYPE_TIMESTAMP2` type codes are used only on the server side. Clients see the `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, and `MYSQL_TYPE_TIMESTAMP` codes.

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to TRUE if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

ENUM and SET values are returned as strings. For these, check that the `type` value is `MYSQL_TYPE_STRING` and that the `ENUM_FLAG` or `SET_FLAG` flag is set in the `flags` value.

## 27.8.6 C API Function Overview

The following list summarizes the functions available in the C API. For greater detail, see the descriptions in [Section 27.8.7, "C API Function Descriptions"](#).

- `my_init()`: Initialize global variables, and thread handler in thread-safe programs
- `mysql_affected_rows()`: Returns the number of rows changed/deleted/inserted by the last UPDATE, DELETE, or INSERT query
- `mysql_autocommit()`: Toggles autocommit mode on/off
- `mysql_change_user()`: Changes user and database on an open connection
- `mysql_character_set_name()`: Return default character set name for current connection
- `mysql_client_find_plugin()`: Return pointer to plugin
- `mysql_client_register_plugin()`: Register a plugin
- `mysql_close()`: Closes a server connection
- `mysql_commit()`: Commits the transaction
- `mysql_connect()`: Connects to a MySQL server (this function is deprecated; use `mysql_real_connect()` instead)
- `mysql_create_db()`: Creates a database (this function is deprecated; use the SQL statement `CREATE DATABASE` instead)
- `mysql_data_seek()`: Seeks to an arbitrary row number in a query result set
- `mysql_debug()`: Does a `DEBUG_PUSH` with the given string
- `mysql_drop_db()`: Drops a database (this function is deprecated; use the SQL statement `DROP DATABASE` instead)
- `mysql_dump_debug_info()`: Makes the server write debug information to the log
- `mysql_eof()`: Determines whether the last row of a result set has been read (this function is deprecated; `mysql_errno()` or `mysql_error()` may be used instead)
- `mysql_errno()`: Returns the error number for the most recently invoked MySQL function
- `mysql_error()`: Returns the error message for the most recently invoked MySQL function

- `mysql_escape_string()`: Escapes special characters in a string for use in an SQL statement
- `mysql_fetch_field()`: Returns the type of the next table field
- `mysql_fetch_field_direct()`: Returns the type of a table field, given a field number
- `mysql_fetch_fields()`: Returns an array of all field structures
- `mysql_fetch_lengths()`: Returns the lengths of all columns in the current row
- `mysql_fetch_row()`: Fetches the next row from the result set
- `mysql_field_count()`: Returns the number of result columns for the most recent statement
- `mysql_field_seek()`: Puts the column cursor on a specified column
- `mysql_field_tell()`: Returns the position of the field cursor used for the last `mysql_fetch_field()`
- `mysql_free_result()`: Frees memory used by a result set
- `mysql_get_character_set_info()`: Return information about default character set
- `mysql_get_client_info()`: Returns client version information as a string
- `mysql_get_client_version()`: Returns client version information as an integer
- `mysql_get_host_info()`: Returns a string describing the connection
- `mysql_get_option()`: Returns the value of a `mysql_options()` option
- `mysql_get_proto_info()`: Returns the protocol version used by the connection
- `mysql_get_server_info()`: Returns the server version number
- `mysql_get_server_version()`: Returns version number of server as an integer
- `mysql_get_ssl_cipher()`: Return current SSL cipher
- `mysql_hex_string()`: Encode string in hexadecimal format
- `mysql_info()`: Returns information about the most recently executed query
- `mysql_init()`: Gets or initializes a `MYSQL` structure
- `mysql_insert_id()`: Returns the ID generated for an `AUTO_INCREMENT` column by the previous query
- `mysql_kill()`: Kills a given thread
- `mysql_library_end()`: Finalize the MySQL C API library
- `mysql_library_init()`: Initialize the MySQL C API library
- `mysql_list_dbs()`: Returns database names matching a simple regular expression
- `mysql_list_fields()`: Returns field names matching a simple regular expression
- `mysql_list_processes()`: Returns a list of the current server threads
- `mysql_list_tables()`: Returns table names matching a simple regular expression
- `mysql_load_plugin()`: Load a plugin
- `mysql_load_plugin_v()`: Load a plugin

- `mysql_more_results()`: Checks whether any more results exist
- `mysql_next_result()`: Returns/initiates the next result in multiple-result executions
- `mysql_num_fields()`: Returns the number of columns in a result set
- `mysql_num_rows()`: Returns the number of rows in a result set
- `mysql_options()`: Sets connect options for `mysql_real_connect()`
- `mysql_options4()`: Sets connect options for `mysql_real_connect()`
- `mysql_ping()`: Checks whether the connection to the server is working, reconnecting as necessary
- `mysql_plugin_options()`: Set a plugin option
- `mysql_query()`: Executes an SQL query specified as a null-terminated string
- `mysql_real_connect()`: Connects to a MySQL server
- `mysql_real_escape_string()`: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection
- `mysql_real_escape_string_quote()`: Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection and the quoting context
- `mysql_real_query()`: Executes an SQL query specified as a counted string
- `mysql_refresh()`: Flush or reset tables and caches
- `mysql_reload()`: Tells the server to reload the grant tables
- `mysql_reset_connection()`: Reset connection to clear session state
- `mysql_rollback()`: Rolls back the transaction
- `mysql_row_seek()`: Seeks to a row offset in a result set, using value returned from `mysql_row_tell()`
- `mysql_row_tell()`: Returns the row cursor position
- `mysql_select_db()`: Selects a database
- `mysql_server_end()`: Finalize the MySQL C API library
- `mysql_server_init()`: Initialize the MySQL C API library
- `mysql_session_track_get_first()`: Get first part of session state-change information
- `mysql_session_track_get_next()`: Get next part of session state-change information
- `mysql_set_character_set()`: Set default character set for current connection
- `mysql_set_local_infile_default()`: Set the `LOAD DATA LOCAL INFILE` handler callbacks to their default values
- `mysql_set_local_infile_handler()`: Install application-specific `LOAD DATA LOCAL INFILE` handler callbacks
- `mysql_set_server_option()`: Sets an option for the connection (like `multi-statements`)
- `mysql_sqlstate()`: Returns the SQLSTATE error code for the last error
- `mysql_shutdown()`: Shuts down the database server

- `mysql_ssl_set()`: Prepare to establish SSL connection to server
- `mysql_stat()`: Returns the server status as a string
- `mysql_store_result()`: Retrieves a complete result set to the client
- `mysql_thread_end()`: Finalize thread handler
- `mysql_thread_id()`: Returns the current thread ID
- `mysql_thread_init()`: Initialize thread handler
- `mysql_thread_safe()`: Returns 1 if the clients are compiled as thread-safe
- `mysql_use_result()`: Initiates a row-by-row result set retrieval
- `mysql_warning_count()`: Returns the warning count for the previous SQL statement

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL client library by calling `mysql_library_init()`. This function exists in both the `libmysqlclient` C client library and the `libmysqld` embedded server library, so it is used whether you build a regular client program by linking with the `-libmysqlclient` flag, or an embedded server application by linking with the `-libmysqld` flag.
2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL client library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL client library. For applications that are linked with the client library, they provide improved memory management. If you do not call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

In a nonmultithreaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. This should be done prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the host name, user name, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. Treat these statements the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Choose the approach that is most appropriate for each client application. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you do not have random access to rows within the result set (you can only access rows sequentially), and the number of rows in the result set is unknown until you have retrieved them all. Furthermore, you *must* retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is nonzero, the statement should have returned rows, but did not. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` enable you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for

the most recently invoked function that can succeed or fail, enabling you to determine when an error occurred and what it was.

## 27.8.7 C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or nonzero to indicate an error. Note that “nonzero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)                /* correct */
    ... error ...

if (result < 0)             /* incorrect */
    ... error ...

if (result == -1)          /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

### 27.8.7.1 `mysql_affected_rows()`

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

#### Description

`mysql_affected_rows()` may be called immediately after executing a statement with `mysql_query()` or `mysql_real_query()`. It returns the number of rows changed, deleted, or inserted by the last statement if it was an `UPDATE`, `DELETE`, or `INSERT`. For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

For `UPDATE` statements, the affected-rows value by default is the number of rows actually changed. If you specify the `CLIENT_FOUND_ROWS` flag to `mysql_real_connect()` when connecting to `mysqld`, the affected-rows value is the number of rows “found”; that is, matched by the `WHERE` clause.

For `REPLACE` statements, the affected-rows value is 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

For `INSERT ... ON DUPLICATE KEY UPDATE` statements, the affected-rows value per row is 1 if the row is inserted as a new row, 2 if an existing row is updated, and 0 if an existing row is set to its current values. If you specify the `CLIENT_FOUND_ROWS` flag, the affected-rows value is 1 (not 0) if an existing row is set to its current values.

Following a `CALL` statement for a stored procedure, `mysql_affected_rows()` returns the value that it would return for the last statement executed within the procedure, or 0 if that statement would return -1. Within the procedure, you can use `ROW_COUNT()` at the SQL level to obtain the affected-rows value for individual statements.

In MySQL 5.7, `mysql_affected_rows()` returns a meaningful value for a wider range of statements. For details, see the description for `ROW_COUNT()` in [Section 12.14, “Information Functions”](#).

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or

that no query has yet been executed. -1 indicates that the query returned an error or that, for a [SELECT](#) query, [mysql\\_affected\\_rows\(\)](#) was called prior to calling [mysql\\_store\\_result\(\)](#).

Because [mysql\\_affected\\_rows\(\)](#) returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

## Errors

None.

## Example

```
char *stmt = "UPDATE products SET cost=cost*1.25
              WHERE group=10";
mysql_query(&mysql, stmt);
printf("%ld products updated",
       (long) mysql_affected_rows(&mysql));
```

### 27.8.7.2 [mysql\\_autocommit\(\)](#)

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

## Description

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

None.

### 27.8.7.3 [mysql\\_change\\_user\(\)](#)

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char
*password, const char *db)
```

## Description

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that include no explicit database specifier.

[mysql\\_change\\_user\(\)](#) fails if the connected user cannot be authenticated or does not have permission to use the database. In this case, the user and database are not changed.

Pass a `db` parameter of `NULL` if you do not want to have a default database.

This function resets the session state as if one had done a new connect and reauthenticated. (See [Section 27.8.20, “C API Automatic Reconnection Control”](#).) It always performs a [ROLLBACK](#) of any active transactions, closes and drops all temporary tables, and unlocks all locked tables. Session system variables are reset to the values of the corresponding global system variables. Prepared statements are released and [HANDLER](#) variables are closed. Locks acquired with [GET\\_LOCK\(\)](#) are released. These effects occur even if the user did not change.

To reset the connection state in a more lightweight manner without changing the user, use [mysql\\_reset\\_connection\(\)](#).

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

The same that you can get from `mysql_real_connect()`, plus:

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.
- `ER_UNKNOWN_COM_ERROR`  
The MySQL server does not implement this command (probably an old server).
- `ER_ACCESS_DENIED_ERROR`  
The user or password was wrong.
- `ER_BAD_DB_ERROR`  
The database did not exist.
- `ER_DBACCESS_DENIED_ERROR`  
The user did not have access rights to the database.
- `ER_WRONG_DB_NAME`  
The database name was too long.

## Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

### 27.8.7.4 `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

## Description

Returns the default character set name for the current connection.

## Return Values

The default character set name

## Errors

None.

### 27.8.7.5 `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

#### Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handler pointed to by `mysql` if the handler was allocated automatically by `mysql_init()` or `mysql_connect()`.

#### Return Values

None.

## Errors

None.

### 27.8.7.6 `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

#### Description

Commits the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.

#### Return Values

Zero for success. Nonzero if an error occurred.

## Errors

None.

### 27.8.7.7 `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd)
```

#### Description

This function is deprecated. Use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you cannot retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

## Return Values

Same as for `mysql_real_connect()`.

## Errors

Same as for `mysql_real_connect()`.

### 27.8.7.8 `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

## Description

Creates the database named by the `db` parameter.

This function is deprecated. Use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## Example

```
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n",
            mysql_error(&mysql));
}
```

### 27.8.7.9 `mysql_data_seek()`

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

## Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number. Specify a value in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

## Return Values

None.

## Errors

None.

### 27.8.7.10 `mysql_debug()`

```
void mysql_debug(const char *debug)
```

## Description

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [Section 28.5.3, “The DEBUG Package”](#).

## Return Values

None.

## Errors

None.

## Example

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:O,/tmp/client.trace");
```

### 27.8.7.11 `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

## Description

Drops the database named by the `db` parameter.

This function is deprecated. Use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### Example

```
if(mysql_drop_db(&mysql, "my_database"))
    fprintf(stderr, "Failed to drop the database: Error: %s\n",
            mysql_error(&mysql));
```

## 27.8.7.12 `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

### Description

Instructs the server to write debugging information to the error log. The connected user must have the [SUPER](#) privilege.

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

## 27.8.7.13 `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

### Description

This function is deprecated. [mysql\\_errno\(\)](#) or [mysql\\_error\(\)](#) may be used instead.

[mysql\\_eof\(\)](#) determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to [mysql\\_store\\_result\(\)](#), the client receives the entire set in one operation. In this case, a `NULL` return from [mysql\\_fetch\\_row\(\)](#) always means the end of the result set has been reached and it is unnecessary to call [mysql\\_eof\(\)](#). When used with [mysql\\_store\\_result\(\)](#), [mysql\\_eof\(\)](#) always returns true.

On the other hand, if you use [mysql\\_use\\_result\(\)](#) to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call [mysql\\_fetch\\_row\(\)](#) repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from [mysql\\_fetch\\_row\(\)](#) does not necessarily mean the end of the result set was reached normally. In this case, you can use [mysql\\_eof\(\)](#) to determine what happened. [mysql\\_eof\(\)](#) returns a nonzero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

## Return Values

Zero for success. Nonzero if the end of the result set has been reached.

## Errors

None.

## Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

### 27.8.7.14 `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

## Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

#### Note

Some functions such as `mysql_fetch_row()` do not set `mysql_errno()` if they succeed. A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using

the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;  
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

## Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

## Errors

None.

### 27.8.7.15 `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

## Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function did not fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_error()`, either of these two tests can be used to check for an error:

```
if(*mysql_error(&mysql))  
{  
    // an error occurred  
}  
  
if(mysql_error(&mysql)[0])  
{  
    // an error occurred  
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages. See [Section 10.11, “Setting the Error Message Language”](#).

## Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

## Errors

None.

### 27.8.7.16 `mysql_escape_string()`

#### Note

Do not use this function. `mysql_escape_string()` does not have arguments that enable it to respect the current character set or the quoting context. Use `mysql_real_escape_string_quote()` instead.

### 27.8.7.17 `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

## Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL does not know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

## Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

## Errors

None.

## Example

```
MYSQL_FIELD *field;

while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

### 27.8.7.18 mysql\_fetch\_field\_direct()

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int
fieldnr)
```

## Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. Use this function to retrieve the definition for an arbitrary column. Specify a value for `fieldnr` in the range from 0 to `mysql_num_fields(result)-1`.

## Return Values

The `MYSQL_FIELD` structure for the specified column.

## Errors

None.

## Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
```

```
    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}
```

### 27.8.7.19 `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

#### Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

#### Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

#### Errors

None.

#### Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}
```

### 27.8.7.20 `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

#### Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

#### Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null bytes). `NULL` if an error occurred.

#### Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

#### Example

```
MYSQL_ROW row;
unsigned long *lengths;
```

```
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n",
              i, lengths[i]);
    }
}
```

### 27.8.7.21 `mysql_fetch_row()`

`MYSQL_ROW` `mysql_fetch_row(MYSQL_RES *result)`

#### Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

#### Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

#### Errors

Errors are not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

#### Example

```
MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("[%.*s] ", (int) lengths[i],
```

```
        row[i] ? row[i] : "NULL");
    }
    printf("\n");
}
```

### 27.8.7.22 `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

#### Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 27.8.21.1, “Why `mysql\_store\_result\(\)` Sometimes Returns `NULL` After `mysql\_query\(\)` Returns Success”](#).

#### Return Values

An unsigned integer representing the number of columns in a result set.

#### Errors

None.

#### Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
        else // mysql_store_result() should have returned data
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
    }
}
```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

### 27.8.7.23 `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result, MYSQL_FIELD_OFFSET offset)
```

#### Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

#### Return Values

The previous value of the field cursor.

#### Errors

None.

### 27.8.7.24 `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

#### Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

#### Return Values

The current offset of the field cursor.

#### Errors

None.

### 27.8.7.25 `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

#### Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

#### Return Values

None.

#### Errors

None.

### 27.8.7.26 `mysql_get_character_set_info()`

```
void mysql_get_character_set_info(MYSQL *mysql, MY_CHARSET_INFO *cs)
```

## Description

This function provides information about the default client character set. The default character set may be changed with the [mysql\\_set\\_character\\_set\(\)](#) function.

## Example

This example shows the fields that are available in the [MY\\_CHARSET\\_INFO](#) structure:

```
if (!mysql_set_character_set(&mysql, "utf8"))
{
    MY_CHARSET_INFO cs;
    mysql_get_character_set_info(&mysql, &cs);
    printf("character set information:\n");
    printf("character set+collation number: %d\n", cs.number);
    printf("character set name: %s\n", cs.name);
    printf("collation name: %s\n", cs.csname);
    printf("comment: %s\n", cs.comment);
    printf("directory: %s\n", cs.dir);
    printf("multi byte character min. length: %d\n", cs.mbminlen);
    printf("multi byte character max. length: %d\n", cs.mbmaxlen);
}
```

### 27.8.7.27 mysql\_get\_client\_info()

```
const char *mysql_get_client_info(void)
```

## Description

Returns a string that represents the MySQL client library version; for example, "5.7.25".

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see [Section 27.8.4.5, "C API Server and Client Library Versions"](#).

## Return Values

A character string that represents the MySQL client library version.

## Errors

None.

### 27.8.7.28 mysql\_get\_client\_version()

```
unsigned long mysql_get_client_version(void)
```

## Description

Returns an integer that represents the MySQL client library version. The value has the format [XYZZ](#) where [X](#) is the major version, [YY](#) is the release level (or minor version), and [ZZ](#) is the sub-version within the release level:

```
major_version*10000 + release_level*100 + sub_version
```

For example, "5.7.25" is returned as 50725.

The function value is the version of MySQL or Connector/C that provides the client library. For more information, see [Section 27.8.4.5, "C API Server and Client Library Versions"](#).

## Return Values

An integer that represents the MySQL client library version.

## Errors

None.

### 27.8.7.29 `mysql_get_host_info()`

```
const char *mysql_get_host_info(MYSQL *mysql)
```

#### Description

Returns a string describing the type of connection in use, including the server host name.

#### Return Values

A character string representing the server host name and the connection type.

## Errors

None.

### 27.8.7.30 `mysql_get_option()`

```
int mysql_get_option(MYSQL *mysql, enum mysql_option option, const void *arg)
```

#### Description

Returns the current value of an option settable using `mysql_options()`. The value should be treated as read only.

The `option` argument is the option for which you want its value. The `arg` argument is a pointer to a variable in which to store the option value. `arg` must be a pointer to a variable of the type appropriate for the `option` argument. The following table shows which variable type to use for each `option` value.

arg Type	Applicable option Values
unsigned int	MYSQL_OPT_CONNECT_TIMEOUT, MYSQL_OPT_PROTOCOL, MYSQL_OPT_READ_TIMEOUT, MYSQL_OPT_RETRY_COUNT, MYSQL_OPT_SSL_MODE, MYSQL_OPT_WRITE_TIMEOUT
unsigned long	MYSQL_OPT_MAX_ALLOWED_PACKET, MYSQL_OPT_NET_BUFFER_LENGTH
my_bool	MYSQL_ENABLE_CLEARTEXT_PLUGIN, MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS, MYSQL_OPT_GET_SERVER_PUBLIC_KEY, MYSQL_OPT_GUESS_CONNECTION, MYSQL_OPT_LOCAL_INFILE, MYSQL_OPT_RECONNECT, MYSQL_OPT_SSL_ENFORCE, MYSQL_OPT_SSL_VERIFY_SERVER_CERT, MYSQL_OPT_USE_EMBEDDED_CONNECTION, MYSQL_OPT_USE_REMOTE_CONNECTION, MYSQL_REPORT_DATA_TRUNCATION, MYSQL_SECURE_AUTH
const char *	MYSQL_DEFAULT_AUTH, MYSQL_OPT_BIND, MYSQL_OPT_SSL_CA, MYSQL_OPT_SSL_CAPATH, MYSQL_OPT_SSL_CERT, MYSQL_OPT_SSL_CIPHER, MYSQL_OPT_SSL_CRL, MYSQL_OPT_SSL_CRLPATH, MYSQL_OPT_SSL_KEY, MYSQL_OPT_TLS_VERSION, MYSQL_PLUGIN_DIR, MYSQL_READ_DEFAULT_FILE, MYSQL_READ_DEFAULT_GROUP, MYSQL_SERVER_PUBLIC_KEY, MYSQL_SET_CHARSET_DIR, MYSQL_SET_CHARSET_NAME, MYSQL_SET_CLIENT_IP, MYSQL_SHARED_MEMORY_BASE_NAME
argument not used	MYSQL_OPT_COMPRESS

arg Type	Applicable option Values
cannot be queried (error is returned)	<code>MYSQL_INIT_COMMAND</code> , <code>MYSQL_OPT_CONNECT_ATTR_DELETE</code> , <code>MYSQL_OPT_CONNECT_ATTR_RESET</code> , <code>MYSQL_OPT_NAMED_PIPE</code>

## Return Values

Zero for success. Nonzero if an error occurred; this occurs for `option` values that cannot be queried.

## Example

The following call tests the `MYSQL_OPT_RECONNECT` option. After the call returns successfully, the value of `reconnect` is true or false to indicate whether automatic reconnection is enabled.

```
my_bool reconnect;

if (mysql_get_option(mysql, MYSQL_OPT_RECONNECT, &reconnect))
    fprintf(stderr, "mysql_get_options() failed\n");
```

### 27.8.7.31 `mysql_get_proto_info()`

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

## Description

Returns the protocol version used by current connection.

## Return Values

An unsigned integer representing the protocol version used by the current connection.

## Errors

None.

### 27.8.7.32 `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

## Description

Returns a string that represents the MySQL server version; for example, `"5.7.25"`.

## Return Values

A character string that represents the MySQL server version.

## Errors

None.

### 27.8.7.33 `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

## Description

Returns an integer that represents the MySQL server version. The value has the format `XYZZ` where `X` is the major version, `YY` is the release level (or minor version), and `ZZ` is the sub-version within the release level:

```
major_version*10000 + release_level*100 + sub_version
```

For example, "5.7.25" is returned as 50725.

This function is useful in client programs for determining whether some version-specific server capability exists.

## Return Values

An integer that represents the MySQL server version.

## Errors

None.

### 27.8.7.34 `mysql_get_ssl_cipher()`

```
const char *mysql_get_ssl_cipher(MYSQL *mysql)
```

## Description

`mysql_get_ssl_cipher()` returns the encryption cipher used for the given connection to the server. `mysql` is the connection handler returned from `mysql_init()`.

## Return Values

A string naming the encryption cipher used for the connection, or `NULL` if the connection is not encrypted.

### 27.8.7.35 `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned long length)
```

## Description

This function creates a legal SQL string for use in an SQL statement. See [Section 9.1.1, “String Literals”](#).

The string in the `from` argument is encoded in hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in the `to` argument, followed by a terminating null byte.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The return value can be placed into an SQL statement using either `X'value'` or `0xvalue` format. However, the return value does not include the `X'...` or `0x`. The caller must supply whichever of those is desired.

## Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"X'");
end += mysql_hex_string(end,"What is this",12);
end = strmov(end,"',X'");
```

```
end += mysql_hex_string(end,"binary data: \0\r\n",16);
end = strmov(end,"'");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
        mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

## Return Values

The length of the encoded string that is placed into `to`, not including the terminating null character.

## Errors

None.

### 27.8.7.36 `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

## Description

Retrieves a string providing information about the most recently executed statement, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of statement, as described here. The numbers are illustrative only; the string contains values appropriate for the statement.

- `INSERT INTO ... SELECT ...`

String format: `Records: 100 Duplicates: 0 Warnings: 0`

- `INSERT INTO ... VALUES (...),(...),(...)...`

String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `LOAD DATA INFILE ...`

String format: `Records: 1 Deleted: 0 Skipped: 0 Warnings: 0`

- `ALTER TABLE`

String format: `Records: 3 Duplicates: 0 Warnings: 0`

- `UPDATE`

String format: `Rows matched: 40 Changed: 40 Warnings: 0`

`mysql_info()` returns a non-`NULL` value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

## Return Values

A character string representing additional information about the most recently executed statement. `NULL` if no information is available for the statement.

## Errors

None.

### 27.8.7.37 `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

#### Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

In a nonmultithreaded environment, `mysql_init()` invokes `mysql_library_init()` automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`. Before calling `mysql_init()`, either call `mysql_library_init()` prior to spawning any threads, or use a mutex to protect the `mysql_library_init()` call. This should be done prior to any other client library call.

#### Return Values

An initialized `MYSQL*` handler. `NULL` if there was insufficient memory to allocate a new object.

#### Errors

In case of insufficient memory, `NULL` is returned.

### 27.8.7.38 `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

#### Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an `AUTO_INCREMENT` field, or have used `INSERT` or `UPDATE` to set a column value with `LAST_INSERT_ID(expr)`.

The return value of `mysql_insert_id()` is always zero unless explicitly updated under one of the following conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit nonspecial value.
- In the case of a multiple-row `INSERT` statement, `mysql_insert_id()` returns the first automatically generated `AUTO_INCREMENT` value that was successfully inserted.

If no rows are successfully inserted, `mysql_insert_id()` returns 0.

- If an `INSERT ... SELECT` statement is executed, and no automatically generated value is successfully inserted, `mysql_insert_id()` returns the ID of the last inserted row.
- If an `INSERT ... SELECT` statement uses `LAST_INSERT_ID(expr)`, `mysql_insert_id()` returns `expr`.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column or by updating any column to `LAST_INSERT_ID(expr)`.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

The return value of `mysql_insert_id()` can be simplified to the following sequence:

1. If there is an `AUTO_INCREMENT` column, and an automatically generated value was successfully inserted, return the first such value.
2. If `LAST_INSERT_ID(expr)` occurred in the statement, return *expr*, even if there was an `AUTO_INCREMENT` column in the affected table.
3. The return value varies depending on the statement used. When called after an `INSERT` statement:
  - If there is an `AUTO_INCREMENT` column in the table, and there were some explicit values for this column that were successfully inserted into the table, return the last of the explicit values.

When called after an `INSERT ... ON DUPLICATE KEY UPDATE` statement:

- If there is an `AUTO_INCREMENT` column in the table and there were some explicit successfully inserted values or some updated values, return the last of the inserted or updated values.

`mysql_insert_id()` returns 0 if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

The `LAST_INSERT_ID()` SQL function will contain the value of the first automatically generated value that was successfully inserted. `LAST_INSERT_ID()` is not reset between statements because the value of that function is maintained in the server. Another difference from `mysql_insert_id()` is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific nonspecial value. See [Section 12.14, “Information Functions”](#).

`mysql_insert_id()` returns 0 following a `CALL` statement for a stored procedure that generates an `AUTO_INCREMENT` value because in this case `mysql_insert_id()` applies to `CALL` and not the statement within the procedure. Within the procedure, you can use `LAST_INSERT_ID()` at the SQL level to obtain the `AUTO_INCREMENT` value.

The reason for the differences between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide more exact information about what happens to the `AUTO_INCREMENT` column.

#### Note

The OK packet used in the client/server protocol holds information such as is used for session state tracking. When clients read the OK packet to know whether there is a session state change, this resets values such as the last insert ID and the number of affected rows. Such changes cause `mysql_insert_id()` to return 0 after execution of commands including but not necessarily limited to `COM_PING`, `COM_REFRESH`, and `COM_INIT_DB`.

## Return Values

Described in the preceding discussion.

## Errors

- `ER_AUTO_INCREMENT_CONFLICT`

A user-specified `AUTO_INCREMENT` value in a multi `INSERT` statement falls within the range between the current `AUTO_INCREMENT` value and the sum of the current and number of rows affected values.

### 27.8.7.39 `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

## Description

### Note

As of MySQL 5.7.11, `mysql_kill()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `KILL` statement.

Asks the server to kill the thread specified by `pid`.

This function is deprecated. Use `mysql_query()` to issue an SQL `KILL` statement instead.

`mysql_kill()` cannot handle values larger than 32 bits, but to guard against killing the wrong thread returns an error in these cases:

- If given an ID larger than 32 bits, `mysql_kill()` returns a `CR_INVALID_CONN_HANDLE` error.
- After the server's internal thread ID counter reaches a value larger than 32 bits, it returns an `ER_DATA_OUT_OF_RANGE` error for any `mysql_kill()` invocation and `mysql_kill()` fails.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_INVALID_CONN_HANDLE`

The `pid` was larger than 32 bits.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

- `ER_DATA_OUT_OF_RANGE`

The server's internal thread ID counter has reached a value larger than 32 bits, at which point it rejects all `mysql_kill()` invocations.

### 27.8.7.40 `mysql_library_end()`

```
void mysql_library_end(void)
```

## Description

This function finalizes the MySQL library. Call it when you are done using the library (for example, after disconnecting from the server). The action taken by the call depends on whether your application is linked to the MySQL client library or the MySQL embedded server library. For a client program linked against the `libmysqlclient` library by using the `-lmysqlclient` flag, `mysql_library_end()` performs some memory management to clean up. For an embedded server application linked against

the `libmysqld` library by using the `-lmysqld` flag, `mysql_library_end()` shuts down the embedded server and then cleans up.

#### Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_library_end()` explicitly. This enables memory management to be performed to clean up and free resources used by the library.

For usage information, see [Section 27.8.6, “C API Function Overview”](#), and [Section 27.8.7.41, “mysql\\_library\\_init\(\)”](#).

### 27.8.7.41 `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

#### Description

Call this function to initialize the MySQL client library before you call any other MySQL function, whether your application is a regular client program or uses the embedded server. If the application uses the embedded server, this call starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses.

#### Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_library_end()` explicitly. This enables memory management to be performed to clean up and free resources used by the library. See [Section 27.8.7.40, “mysql\\_library\\_end\(\)”](#).

The choice of whether the application operates as a regular client or uses the embedded server depends on whether you use the `libmysqlclient` or `libmysqld` library at link time to produce the final executable. For additional information, see [Section 27.8.6, “C API Function Overview”](#).

In a nonmultithreaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, `mysql_library_init()` is not thread-safe in a multithreaded environment, and thus neither is `mysql_init()`, which calls `mysql_library_init()`. You must either call `mysql_library_init()` prior to spawning any threads, or else use a mutex to protect the call, whether you invoke `mysql_library_init()` or indirectly through `mysql_init()`. Do this prior to any other client library call.

The `argc` and `argv` arguments are analogous to the arguments to `main()`, and enable passing of options to the embedded server. For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. This is the usual case for applications intended for use only as regular (nonembedded) clients, and the call typically is written as `mysql_library_init(0, NULL, NULL)`.

```
#include <mysql.h>
#include <stdlib.h>

int main(void) {
    if (mysql_library_init(0, NULL, NULL)) {
        fprintf(stderr, "could not initialize MySQL client library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();

    return EXIT_SUCCESS;
}
```

When arguments are to be passed (`argc` is greater than 0), the first element of `argv` is ignored (it typically contains the program name). `mysql_library_init()` makes a copy of the arguments so it is safe to destroy `argv` or `groups` after the call.

For embedded applications, if you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `groups` argument is an array of strings that indicate the groups in option files from which to read options. See [Section 4.2.6, “Using Option Files”](#). Make the final entry in the array `NULL`. For convenience, if the `groups` argument itself is `NULL`, the `[server]` and `[embedded]` groups are used by default.

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program",          /* this string is not used */
    "--datadir=.",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
    if (mysql_library_init(sizeof(server_args) / sizeof(char *),
                          server_args, server_groups)) {
        fprintf(stderr, "could not initialize MySQL client library\n");
        exit(1);
    }

    /* Use any MySQL API functions here */

    mysql_library_end();

    return EXIT_SUCCESS;
}
```

## Return Values

Zero for success. Nonzero if an error occurred.

### 27.8.7.42 `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

## Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW DATABASES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

## Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- [CR\\_OUT\\_OF\\_MEMORY](#)

Out of memory.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.7.43 `mysql_list_fields()`

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

#### Description

##### Note

As of MySQL 5.7.11, `mysql_list_fields()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHOW COLUMNS` statement.

Returns an empty result set for which the metadata provides information about the columns in the given table that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

It is preferable to use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A [MYSQL\\_RES](#) result set for success. [NULL](#) if an error occurred.

#### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

## Example

```
int i;
MYSQL_RES *tbl_cols = mysql_list_fields(mysql, "mytbl", "f%");

unsigned int field_cnt = mysql_num_fields(tbl_cols);
printf("Number of columns: %d\n", field_cnt);

for (i=0; i < field_cnt; ++i)
{
    /* col describes i-th column of the table */
    MYSQL_FIELD *col = mysql_fetch_field_direct(tbl_cols, i);
    printf ("Column %d: %s\n", i, col->name);
}
mysql_free_result(tbl_cols);
```

### 27.8.7.44 mysql\_list\_processes()

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

#### Description

#### Note

As of MySQL 5.7.11, `mysql_list_processes()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a `SHOW PROCESSLIST` statement.

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 27.8.7.45 mysql\_list\_tables()

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

#### Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `%` or `_`, or

may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW TABLES [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

## Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 27.8.7.46 `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

## Description

This function is used when you execute multiple statements specified as a single statement string, or when you execute `CALL` statements, which can return multiple result sets.

`mysql_more_results()` true if more results exist from the currently executed statement, in which case the application must call `mysql_next_result()` to fetch the results.

## Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 27.8.16, “C API Multiple Statement Execution Support”](#), and [Section 27.8.7.47, “mysql\\_next\\_result\(\)”](#).

## Errors

None.

### 27.8.7.47 `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

## Description

This function is used when you execute multiple statements specified as a single statement string, or when you use `CALL` statements to execute stored procedures, which can return multiple result sets.

`mysql_next_result()` reads the next statement result and returns a status to indicate whether more results exist. If `mysql_next_result()` returns an error, there are no more results.

Before each call to `mysql_next_result()`, you must call `mysql_free_result()` for the current statement if it is a statement that returned a result set (rather than just a result status).

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next statement. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). In MySQL 5.7, `CLIENT_MULTI_RESULTS` is enabled by default.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_next_result()` to advance to the next result.

For an example that shows how to use `mysql_next_result()`, see [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

## Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order. For example, if you did not call `mysql_use_result()` for a previous result set.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 27.8.7.48 `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

To pass a `MYSQL*` argument instead, use `unsigned int mysql_field_count(MYSQL *mysql)`.

## Description

Returns the number of columns in a result set.

You can get the number of columns either from a pointer to a result set or to a connection handler. You would use the connection handler if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a nonempty result. This enables the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT-like`) statement. The example shown here illustrates how this may be done.

See [Section 27.8.21.1, “Why mysql\\_store\\_result\(\) Sometimes Returns NULL After mysql\\_query\(\) Returns Success”](#).

## Return Values

An unsigned integer representing the number of columns in a result set.

## Errors

None.

## Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` returns 0. This happens only if something went wrong.

### 27.8.7.49 mysql\_num\_rows()

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

## Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`,

`mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

`mysql_num_rows()` is intended for use with statements that return a result set, such as [SELECT](#). For statements such as [INSERT](#), [UPDATE](#), or [DELETE](#), the number of affected rows can be obtained with `mysql_affected_rows()`.

## Return Values

The number of rows in the result set.

## Errors

None.

### 27.8.7.50 `mysql_options()`

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const void *arg)
```

## Description

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options. To retrieve option values, use `mysql_get_option()`.

Call `mysql_options()` after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, specify a pointer to the value of the integer as the `arg` argument.

Options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in [Section 27.8.15, “C API Encrypted Connection Support”](#).

The following list describes the possible options, their effect, and how `arg` is used for each option. For option descriptions that indicate `arg` is unused, its value is irrelevant; it is conventional to pass 0. Several of the options apply only when the application is linked against the `libmysqld` embedded server library and are unused for applications linked against the `libmysqlclient` client library.

- `MYSQL_DEFAULT_AUTH` (argument type: `char *`)

The name of the authentication plugin to use.

- `MYSQL_ENABLE_CLEARTEXT_PLUGIN` (argument type: `my_bool *`)

Enable the `mysql_clear_password` cleartext authentication plugin. See [Section 6.5.1.6, “Client-Side Cleartext Pluggable Authentication”](#).

- `MYSQL_INIT_COMMAND` (argument type: `char *`)

SQL statement to execute when connecting to the MySQL server. Automatically re-executed if reconnection occurs.

- `MYSQL_OPT_BIND` (argument: `char *`)

The network interface from which to connect to the server. This is used when the client host has multiple network interfaces. The argument is a host name or IP address (specified as a string).

- `MYSQL_OPT_CAN_HANDLE_EXPIRED_PASSWORDS` (argument type: `my_bool *`)

Indicate whether the client can handle expired passwords. See [Section 6.3.8, “Password Expiration and Sandbox Mode”](#).

- `MYSQL_OPT_COMPRESS` (argument: not used)

Use the compressed client/server protocol.

- `MYSQL_OPT_CONNECT_ATTR_DELETE` (argument type: `char *`)

Given a key name, this option deletes a key/value pair from the current set of connection attributes to pass to the server at connect time. The argument is a pointer to a null-terminated string naming the key. Comparison of the key name with existing keys is case-sensitive.

See also the description for the `MYSQL_OPT_CONNECT_ATTR_RESET` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See [Section 25.11.9, “Performance Schema Connection Attribute Tables”](#).

- `MYSQL_OPT_CONNECT_ATTR_RESET` (argument not used)

This option resets (clears) the current set of connection attributes to pass to the server at connect time.

See also the description for the `MYSQL_OPT_CONNECT_ATTR_DELETE` option, as well as the description for the `MYSQL_OPT_CONNECT_ATTR_ADD` option in the description of the `mysql_options4()` function. That function description also includes a usage example.

The Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables. See [Section 25.11.9, “Performance Schema Connection Attribute Tables”](#).

- `MYSQL_OPT_CONNECT_TIMEOUT` (argument type: `unsigned int *`)

The connect timeout in seconds.

- `MYSQL_OPT_GET_SERVER_PUBLIC_KEY` (argument type: `my_bool *`)

Enables the client to request from the server the public key required for RSA key pair-based password exchange. This option applies to clients that authenticate with the `caching_sha2_password` authentication plugin. For that plugin, the server does not send the public key unless requested. This option is ignored for accounts that do not authenticate with that plugin. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

If `MYSQL_SERVER_PUBLIC_KEY` is given and specifies a valid public key file, it takes precedence over `MYSQL_OPT_GET_SERVER_PUBLIC_KEY`.

For information about the `caching_sha2_password` plugin, see [Section 6.5.1.5, “Caching SHA-2 Pluggable Authentication”](#).

This option was added in MySQL 5.7.23.

- `MYSQL_OPT_GUESS_CONNECTION` (argument: not used)

For an application linked against the `libmysql` embedded server library, this option enables the library to guess whether to use the embedded server or a remote server. “Guess” means that if the host name is set and is not `localhost`, it uses a remote server. This behavior is the default. `MYSQL_OPT_USE_EMBEDDED_CONNECTION` and `MYSQL_OPT_USE_REMOTE_CONNECTION` can be used to override it. This option is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_LOCAL_INFILE` (argument type: optional pointer to `unsigned int`)

This option affects client-side `LOCAL` capability for `LOAD DATA` operations. By default, `LOCAL` capability is determined by the default compiled into the MySQL client library (see [Section 13.2.6, “LOAD DATA INFILE Syntax”](#)). To control this capability explicitly, invoke `mysql_options()` to set the `MYSQL_OPT_LOCAL_INFILE` option:

- `LOCAL` is disabled if the pointer points to an `unsigned int` that has a zero value.
- `LOCAL` is enabled if no pointer is given or if the pointer points to an `unsigned int` that has a nonzero value.

Successful use of a `LOCAL` load operation by a client also requires that the server permits it.

- `MYSQL_OPT_MAX_ALLOWED_PACKET` (argument: `unsigned long *`)

This option sets the `max_allowed_packet` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- `MYSQL_OPT_NAMED_PIPE` (argument: not used)

Use a named pipe to connect to the MySQL server on Windows, if the server permits named-pipe connections.

- `MYSQL_OPT_NET_BUFFER_LENGTH` (argument: `unsigned long *`)

This option sets the `net_buffer_length` system variable. If the `mysql` argument is non-`NULL`, the call sets the session system variable value for that session. If `mysql` is `NULL`, the call sets the global system variable value.

- `MYSQL_OPT_PROTOCOL` (argument type: `unsigned int *`)

Type of protocol to use. Specify one of the enum values of `mysql_protocol_type` defined in `mysql.h`.

- `MYSQL_OPT_READ_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for each attempt to read from the server. There are retries if necessary, so the total effective timeout value is three times the option value. You can set the value so that a lost connection can be detected earlier than the TCP/IP `Close_Wait_Timeout` value of 10 minutes.

- `MYSQL_OPT_RECONNECT` (argument type: `my_bool *`)

Enable or disable automatic reconnection to the server if the connection is found to have been lost. Reconnect is off by default; this option provides a way to set reconnection behavior explicitly. See [Section 27.8.20, “C API Automatic Reconnection Control”](#).

- `MYSQL_OPT_RETRY_COUNT` (argument type: `unsigned int *`)

The retry count for I/O-related system calls that are interrupted while connecting to the server or communicating with it. The default value is 1 (1 retry if the initial call is interrupted for 2 tries total).

This option can be used only by clients that link against a C client library compiled with NDB Cluster support. It is available as of MySQL NDB Cluster 7.5.1.

- `MYSQL_OPT_SSL_CA` (argument type: `char *`)

The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.

- `MYSQL_OPT_SSL_CAPATH` (argument type: `char *`)

The path name of the directory that contains trusted SSL CA certificate files.

- `MYSQL_OPT_SSL_CERT` (argument type: `char *`)

The path name of the client public key certificate file.

- `MYSQL_OPT_SSL_CIPHER` (argument type: `char *`)

The list of permitted ciphers for SSL encryption.

- `MYSQL_OPT_SSL_CRL` (argument type: `char *`)

The path name of the file containing certificate revocation lists.

- `MYSQL_OPT_SSL_CRLPATH` (argument type: `char *`)

The path name of the directory that contains files containing certificate revocation lists.

- `MYSQL_OPT_SSL_ENFORCE` (argument type: `my_bool *`)

Whether to require the connection to use SSL. If enabled and an encrypted connection cannot be established, the connection attempt fails.

This option is deprecated as of MySQL 5.7.11 and is removed in MySQL 8.0. Instead, use `MYSQL_OPT_SSL_MODE` with a value of `SSL_MODE_REQUIRED`.

- `MYSQL_OPT_SSL_KEY` (argument type: `char *`)

The path name of the client private key file.

- `MYSQL_OPT_SSL_MODE` (argument type: `unsigned int *`)

The security state to use for the connection to the server: `SSL_MODE_DISABLED`, `SSL_MODE_PREFERRED`, `SSL_MODE_REQUIRED`, `SSL_MODE_VERIFY_CA`, `SSL_MODE_VERIFY_IDENTITY`. The default is `SSL_MODE_PREFERRED`. These modes are the permitted values of the `mysql_ssl_mode` enumeration defined in `mysql.h`. For more information about the security states, see the description of `--ssl-mode` in [Section 6.4.2, “Command Options for Encrypted Connections”](#).

This option was added in MySQL 5.7.11.

- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT` (argument type: `my_bool *`)

Enable or disable verification of the server's Common Name identity in its certificate against the host name used when connecting to the server. The connection is rejected if there is a mismatch. For encrypted connections, this feature can be used to prevent man-in-the-middle attacks. Identity verification is disabled by default.

This option does not work with self-signed certificates, which do not contain the server name as the Common Name value.

This option is deprecated as of MySQL 5.7.11 and is removed in MySQL 8.0. Instead, use `MYSQL_OPT_SSL_MODE` with a value of `SSL_MODE_VERIFY_IDENTITY`.

- `MYSQL_OPT_TLS_VERSION` (argument type: `char *`)

The protocols permitted by the client for encrypted connections. The value is a comma-separated list containing one or more protocol names. The protocols that can be named for this option depend on the SSL library used to compile MySQL. For details, see [Section 6.4.6, “Encrypted Connection Protocols and Ciphers”](#).

This option was added in MySQL 5.7.10.

- `MYSQL_OPT_USE_EMBEDDED_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this option forces the use of the embedded server for the connection. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_REMOTE_CONNECTION` (argument: not used)

For an application linked against the `libmysqld` embedded server library, this option forces the use of a remote server for the connection. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_OPT_USE_RESULT` (argument: not used)

This option is unused.

- `MYSQL_OPT_WRITE_TIMEOUT` (argument type: `unsigned int *`)

The timeout in seconds for each attempt to write to the server. There is a retry if necessary, so the total effective timeout value is two times the option value.

- `MYSQL_PLUGIN_DIR` (argument type: `char *`)

The directory in which to look for client plugins.

- `MYSQL_READ_DEFAULT_FILE` (argument type: `char *`)

Read options from the named option file instead of from `my.cnf`.

- `MYSQL_READ_DEFAULT_GROUP` (argument type: `char *`)

Read options from the named group from `my.cnf` or the file specified with `MYSQL_READ_DEFAULT_FILE`.

- `MYSQL_REPORT_DATA_TRUNCATION` (argument type: `my_bool *`)

Enable or disable reporting of data truncation errors for prepared statements using the `error` member of `MYSQL_BIND` structures. (Default: enabled.)

- `MYSQL_SECURE_AUTH` (argument type: `my_bool *`)

Whether to connect to a server that does not support the password hashing used in MySQL 4.1.1 and later. This option is enabled by default.

- `MYSQL_SERVER_PUBLIC_KEY` (argument type: `char *`)

The path name to a file containing a client-side copy of the public key required by the server for RSA key pair-based password exchange. The file must be in PEM format. This option applies to clients that authenticate with the `sha256_password` authentication plugin. This option is ignored for accounts that do not authenticate with one of those plugins. It is also ignored if RSA-based password exchange is not used, as is the case when the client connects to the server using a secure connection.

If `MYSQL_SERVER_PUBLIC_KEY` is given and specifies a valid public key file, it takes precedence over `MYSQL_OPT_GET_SERVER_PUBLIC_KEY`.

For information about the `sha256_password` and `caching_sha2_password` plugins, see [Section 6.5.1.4, “SHA-256 Pluggable Authentication”](#), and [Section 6.5.1.5, “Caching SHA-2 Pluggable Authentication”](#).

- `MYSQL_SET_CHARSET_DIR` (argument type: `char *`)

The path name of the directory that contains character set definition files.

- `MYSQL_SET_CHARSET_NAME` (argument type: `char *`)

The name of the character set to use as the default character set. The argument can be `MYSQL_AUTODETECT_CHARSET_NAME` to cause the character set to be autodetected based on the operating system setting (see [Section 10.4, “Connection Character Sets and Collations”](#)).

- `MYSQL_SET_CLIENT_IP` (argument type: `char *`)

For an application linked against the `libmysqld` embedded server library (when `libmysqld` is compiled with authentication support), this option means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. It is ignored for applications linked against the `libmysqlclient` client library.

- `MYSQL_SHARED_MEMORY_BASE_NAME` (argument type: `char *`)

The name of the shared-memory object for communication to the server on Windows, if the server supports shared-memory connections. Specify the same value as the `--shared-memory-base-name` option used for the `mysqld` server you want to connect to.

The `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options.

Option	Description
<code>character-sets-dir=dir_name</code>	The directory where character sets are installed.
<code>compress</code>	Use the compressed client/server protocol.
<code>connect-timeout=seconds</code>	The connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>database=db_name</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>default-character-set=charset_name</code>	The default character set to use.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL INFILE</code> .
<code>enable-cleartext-plugin</code>	Enable the <code>mysql_clear_password</code> cleartext authentication plugin.
<code>host=host_name</code>	Default host name.
<code>init-command=stmt</code>	Statement to execute when connecting to MySQL server. Automatically re-executed if reconnection occurs.
<code>interactive-timeout=seconds</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See <a href="#">Section 27.8.7.54, “mysql_real_connect()”</a> .
<code>local-infile[={0 1}]</code>	If no argument or nonzero argument, enable use of <code>LOAD DATA LOCAL</code> ; otherwise disable.
<code>max_allowed_packet=bytes</code>	Maximum size of packet that client can read from server.
<code>multi-queries, multi-results</code>	Enable multiple result sets from multiple-statement executions or stored procedures.
<code>multi-statements</code>	Enable the client to send multiple statements in a single string (separated by <code>;</code> characters).
<code>password=password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on Windows.

Option	Description
<code>port=port_num</code>	Default port number.
<code>protocol={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>shared-memory-base-name=name</code>	Shared-memory name to use to connect to server.
<code>socket={file_name pipe_name}</code>	Default socket file.
<code>ssl-ca=file_name</code>	Certificate Authority file.
<code>ssl-capath=dir_name</code>	Certificate Authority directory.
<code>ssl-cert=file_name</code>	Certificate file.
<code>ssl-cipher=cipher_list</code>	Permissible SSL ciphers.
<code>ssl-key=file_name</code>	Key file.
<code>timeout=seconds</code>	Like <code>connect-timeout</code> .
<code>user</code>	Default user.

`timeout` has been replaced by `connect-timeout`, but `timeout` is still supported for backward compatibility.

For more information about option files used by MySQL programs, see [Section 4.2.6, “Using Option Files”](#).

## Return Values

Zero for success. Nonzero if you specify an unknown option.

## Example

The following `mysql_options()` calls request the use of compression in the client/server protocol, cause options to be read from the `[odbc]` group in option files, and disable transaction autocommit mode:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql, MYSQL_OPT_COMPRESS, 0);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "odbc");
mysql_options(&mysql, MYSQL_INIT_COMMAND, "SET autocommit=0");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

### 27.8.7.51 mysql\_options4()

```
int mysql_options4(MYSQL *mysql, enum mysql_option option, const void *arg1,
const void *arg2)
```

## Description

`mysql_options4()` is similar to `mysql_options()` but has an extra fourth argument so that two values can be passed for the option specified in the second argument.

The following list describes the permitted options, their effect, and how `arg1` and `arg2` are used.

- `MYSQL_OPT_CONNECT_ATTR_ADD` (argument types: `char *`, `char *`)

This option adds an attribute key/value pair to the current set of connection attributes to pass to the server at connect time. Both arguments are pointers to null-terminated strings. The first and second strings indicate the key and value, respectively. If the key is empty or already exists in the current set of connection attributes, an error occurs. Comparison of the key name with existing keys is case-sensitive.

Key names that begin with an underscore (`_`) are reserved for internal use and should not be created by application programs. This convention permits new attributes to be introduced by MySQL without colliding with application attributes.

`mysql_options4()` imposes a limit of 64KB on the aggregate size of connection attribute data it will accept. For calls that cause this limit to be exceeded, a `CR_INVALID_PARAMETER_NO` error occurs. Attribute size-limit checks also occur on the server side. For details, see [Section 25.11.9, “Performance Schema Connection Attribute Tables”](#), which also describes how the Performance Schema exposes connection attributes through the `session_connect_attrs` and `session_account_connect_attrs` tables.

See also the descriptions for the `MYSQL_OPT_CONNECT_ATTR_RESET`, `MYSQL_OPT_CONNECT_ATTR_DELETE` options in the description of the `mysql_options()` function.

## Return Values

Zero for success. Nonzero if you specify an unknown option.

## Errors

- `CR_DUPLICATE_CONNECTION_ATTR`

A duplicate attribute name was specified.

- `CR_INVALID_PARAMETER_NO`

A key name was empty or the amount of key/value connection attribute data exceeds 64KB limit.

- `CR_OUT_OF_MEMORY`

Out of memory.

## Example

This example demonstrates the calls that specify connection attributes:

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_CONNECT_ATTR_RESET, 0);
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key1", "value1");
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key2", "value2");
mysql_options4(&mysql,MYSQL_OPT_CONNECT_ATTR_ADD, "key3", "value3");
mysql_options(&mysql,MYSQL_OPT_CONNECT_ATTR_DELETE, "key1");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
        mysql_error(&mysql));
}
```

### 27.8.7.52 `mysql_ping()`

```
int mysql_ping(MYSQL *mysql)
```

## Description

Checks whether the connection to the server is working. If the connection has gone down and auto-reconnect is enabled an attempt to reconnect is made. If the connection is down and auto-reconnect is disabled, `mysql_ping()` returns an error.

Auto-reconnect is disabled by default. To enable it, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option. For details, see [Section 27.8.7.50, “mysql\\_options\(\)”](#).

`mysql_ping()` can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

If `mysql_ping()` does cause a reconnect, there is no explicit indication of it. To determine whether a reconnect occurs, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier has changed.

If reconnect occurs, some characteristics of the connection will have been reset. For details about these characteristics, see [Section 27.8.20, “C API Automatic Reconnection Control”](#).

## Return Values

Zero if the connection to the server is active. Nonzero if an error occurred. A nonzero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## 27.8.7.53 `mysql_query()`

```
int mysql_query(MYSQL *mysql, const char *stmt_str)
```

## Description

Executes the SQL statement pointed to by the null-terminated string `stmt_str`. Normally, the string must consist of a single SQL statement without a terminating semicolon (;) or \g. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.)

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See [Section 27.8.7.22, “mysql\\_field\\_count\(\)”](#).

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.7.54 `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char
*user, const char *passwd, const char *db, unsigned int port, const char
*unix_socket, unsigned long client_flag)
```

## Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handler structure.

The parameters are specified as follows:

- For the first parameter, specify the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()`, call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See [Section 27.8.7.50, “mysql\\_options\(\)”](#).
- The value of `host` may be either a host name or an IP address. If `host` is `NULL` or the string `"localhost"`, a connection to the local host is assumed. For Windows, the client connects using a shared-memory connection, if the server has shared-memory connections enabled. Otherwise, TCP/IP is used. For Unix, the client connects using a Unix socket file. For local connections, you can also influence the type of connection to use with the `MYSQL_OPT_PROTOCOL` or `MYSQL_OPT_NAMED_PIPE` options to `mysql_options()`. The type of connection must be supported by the server. For a `host` value of `"."` on Windows, the client connects using a named pipe, if the server has named-pipe connections enabled. If named-pipe connections are not enabled, an error occurs.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string `" "`, the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current user name must be specified explicitly. See the Connector/ODBC section of [Chapter 27, Connectors and APIs](#).
- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This enables the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

#### Note

Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- The `user` and `passwd` parameters use whatever character set has been configured for the `MYSQL` object. By default, this is `latin1`, but can be changed by calling `mysql_options(mysql, MYSQL_SET_CHARSET_NAME, "charset_name")` prior to connecting.
- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe to use. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:
  - `CAN_HANDLE_EXPIRED_PASSWORDS`: The client can handle expired passwords. For more information, see [Section 6.3.8, “Password Expiration and Sandbox Mode”](#).
  - `CLIENT_COMPRESS`: Use compression in the client/server protocol.
  - `CLIENT_FOUND_ROWS`: Return the number of found (matched) rows, not the number of changed rows.
  - `CLIENT_IGNORE_SIGPIPE`: Prevents the client library from installing a `SIGPIPE` signal handler. This can be used to avoid conflicts with a handler that the application has already installed.
  - `CLIENT_IGNORE_SPACE`: Permit spaces after function names. Makes all functions names reserved words.
  - `CLIENT_INTERACTIVE`: Permit `interactive_timeout` seconds of inactivity (rather than `wait_timeout` seconds) before closing the connection. The client's session `wait_timeout` variable is set to the value of the session `interactive_timeout` variable.
  - `CLIENT_LOCAL_FILES`: Enable `LOAD DATA LOCAL` handling.
  - `CLIENT_MULTI_RESULTS`: Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This flag is automatically enabled if `CLIENT_MULTI_STATEMENTS` is enabled. See the note following this table for more information about this flag.
  - `CLIENT_MULTI_STATEMENTS`: Tell the server that the client may send multiple statements in a single string (separated by `;` characters). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag.
  - `CLIENT_NO_SCHEMA`: Do not permit `db_name.tbl_name.col_name` syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
  - `CLIENT_ODBC`: Unused.
  - `CLIENT_SSL`: Use SSL (encrypted protocol). Do not set this option within an application program; it is set internally in the client library. Instead, use `mysql_options()` or `mysql_ssl_set()` before calling `mysql_real_connect()`.
  - `CLIENT_REMEMBER_OPTIONS`: Remember options specified by calls to `mysql_options()`. Without this option, if `mysql_real_connect()` fails, you must repeat the `mysql_options()` calls before trying to connect again. With this option, the `mysql_options()` calls need not be repeated.

If your program uses `CALL` statements to execute stored procedures, the `CLIENT_MULTI_RESULTS` flag must be enabled. This is because each `CALL` returns a result to indicate the call status, in addition

to any result sets that might be returned by statements executed within the procedure. Because `CALL` can return multiple results, process them using a loop that calls `mysql_next_result()` to determine whether there are more results.

`CLIENT_MULTI_RESULTS` can be enabled when you call `mysql_real_connect()`, either explicitly by passing the `CLIENT_MULTI_RESULTS` flag itself, or implicitly by passing `CLIENT_MULTI_STATEMENTS` (which also enables `CLIENT_MULTI_RESULTS`). In MySQL 5.7, `CLIENT_MULTI_RESULTS` is enabled by default.

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string ( `" "` ).
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

## Return Values

A `MYSQL*` connection handler if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

## Errors

- `CR_CONN_HOST_ERROR`  
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`  
Failed to connect to the local MySQL server.
- `CR_IPSOCK_ERROR`  
Failed to create an IP socket.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SOCKET_CREATE_ERROR`

Failed to create a Unix socket.

- [CR\\_UNKNOWN\\_HOST](#)

Failed to find the IP address for the host name.

- [CR\\_VERSION\\_ERROR](#)

A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version.

- [CR\\_NAMEDPIPEOPEN\\_ERROR](#)

Failed to create a named pipe on Windows.

- [CR\\_NAMEDPIPEWAIT\\_ERROR](#)

Failed to wait for a named pipe on Windows.

- [CR\\_NAMEDPIPESETSTATE\\_ERROR](#)

Failed to get a pipe handler on Windows.

- [CR\\_SERVER\\_LOST](#)

If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

- [CR\\_ALREADY\\_CONNECTED](#)

The `MYSQL` connection handler is already connected.

## Example

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql, MYSQL_READ_DEFAULT_GROUP, "your_prog_name");
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL client library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some nonstandard way.

Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1` in versions of the API older than 5.0.3, or `0` in newer versions. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. You can use the `MYSQL_OPT_RECONNECT` option to `mysql_options()` to control reconnection behavior.

### 27.8.7.55 `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const char
*from, unsigned long length)
```

## Description

This function creates a legal SQL string for use in an SQL statement. See [Section 9.1.1, “String Literals”](#).

**Note**

`mysql_real_escape_string()` fails and produces an `CR_INSECURE_API_ERR` error if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled. In this case, the function cannot escape quote characters except by doubling them, and to do this properly, it must know more information about the quoting context than is available. Instead, use `mysql_real_escape_string_quote()`, which takes an extra argument for specifying the quoting context.

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, `NUL` (ASCII 0), `\n`, `\r`, and Control+Z. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in [Section 9.1.1, “String Literals”](#), and [Section 12.5, “String Functions”](#).

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

**Example**

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```
char query[1000],*end;

end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string(&mysql,end,"What is this",12);
end = my_stpcpy(end,"','");
end += mysql_real_escape_string(&mysql,end,"binary data: \0\r\n",16);
end = my_stpcpy(end,"')");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

**Return Values**

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte, or -1 if an error occurs.

Because `mysql_real_escape_string()` returns an unsigned value, you can check for -1 by comparing the return value to `(unsigned long)-1` (or to `(unsigned long)~0`, which is equivalent).

## Errors

- `CR_INSECURE_API_ERR`

This error occurs if the `NO_BACKSLASH_ESCAPES` SQL mode is enabled because, in that case, `mysql_real_escape_string()` cannot be guaranteed to produce a properly encoded result. To avoid this error, use `mysql_real_escape_string_quote()` instead.

### 27.8.7.56 `mysql_real_escape_string_quote()`

```
unsigned long mysql_real_escape_string_quote(MYSQL *mysql, char *to, const
char *from, unsigned long length, char quote)
```

## Description

This function creates a legal SQL string for use in an SQL statement. See [Section 9.1.1, “String Literals”](#).

The `mysql` argument must be a valid, open connection because character escaping depends on the character set in use by the server.

The string in the `from` argument is encoded to produce an escaped SQL string, taking into account the current character set of the connection. The result is placed in the `to` argument, followed by a terminating null byte.

Characters encoded are `\`, `'`, `"`, `NUL` (ASCII 0), `\n`, `\r`, Control+Z, and ```. Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. `mysql_real_escape_string_quote()` quotes the other characters to make them easier to read in log files. For comparison, see the quoting rules for literal strings and the `QUOTE()` SQL function in [Section 9.1.1, “String Literals”](#), and [Section 12.5, “String Functions”](#).

#### Note

If the `ANSI_QUOTES` SQL mode is enabled, `mysql_real_escape_string_quote()` cannot be used to escape double quote characters for use within double-quoted identifiers. (The function cannot tell whether the mode is enabled to determine the proper escaping character.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and there must be room for the terminating null byte.) When `mysql_real_escape_string_quote()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null byte.

The `quote` argument indicates the context in which the escaped string is to be placed. Suppose that you intend to escape the `from` argument and insert the escaped string (designated here by `str`) into one of the following statements:

```
1) SELECT * FROM table WHERE name = 'str'
2) SELECT * FROM table WHERE name = "str"
3) SELECT * FROM `str` WHERE id = 103
```

To perform escaping properly for each statement, call `mysql_real_escape_string_quote()` as follows, where the final argument indicates the quoting context:

```
1) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'');
```

```
2) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'');
3) len = mysql_real_escape_string_quote(&mysql,to,from,from_len,'`');
```

If you must change the character set of the connection, use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string_quote()`, which `SET NAMES` does not.

## Example

The following example inserts two escaped strings into an `INSERT` statement, each within single quote characters:

```
char query[1000],*end;

end = my_stpcpy(query,"INSERT INTO test_table VALUES('");
end += mysql_real_escape_string_quote(&mysql,end,"What is this",12,'\'');
end = my_stpcpy(end,"','");
end += mysql_real_escape_string_quote(&mysql,end,"binary data: \0\r\n",16,'\'');
end = my_stpcpy(end,"')");

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `my_stpcpy()` function used in the example is included in the `libmysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

## Return Values

The length of the encoded string that is placed into the `to` argument, not including the terminating null byte.

## Errors

None.

### 27.8.7.57 mysql\_real\_query()

```
int mysql_real_query(MYSQL *mysql, const char *stmt_str, unsigned long
length)
```

## Description

Executes the SQL statement pointed to by `stmt_str`, a string `length` bytes long. Normally, the string must consist of a single SQL statement without a terminating semicolon (;) or `\g`. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

`mysql_query()` cannot be used for statements that contain binary data; you must use `mysql_real_query()` instead. (Binary data may contain the `\0` character, which `mysql_query()` interprets as the end of the statement string.) In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the statement string.

If you want to know whether the statement returns a result set, you can use `mysql_field_count()` to check for this. See [Section 27.8.7.22, “mysql\\_field\\_count\(\)”](#).

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)  
Commands were executed in an improper order.
- [CR\\_SERVER\\_GONE\\_ERROR](#)  
The MySQL server has gone away.
- [CR\\_SERVER\\_LOST](#)  
The connection to the server was lost during the query.
- [CR\\_UNKNOWN\\_ERROR](#)  
An unknown error occurred.

### 27.8.7.58 `mysql_refresh()`

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

#### Description

#### Note

As of MySQL 5.7.11, `mysql_refresh()` is deprecated and will be removed in a future version of MySQL. Instead, use `mysql_query()` to execute a [FLUSH](#) statement.

This function flushes tables or caches, or resets replication server information. The connected user must have the [RELOAD](#) privilege.

The `options` argument is a bitmask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- [REFRESH\\_GRANT](#)  
Refresh the grant tables, like [FLUSH PRIVILEGES](#).
- [REFRESH\\_LOG](#)  
Flush the logs, like [FLUSH LOGS](#).
- [REFRESH\\_TABLES](#)  
Flush the table cache, like [FLUSH TABLES](#).
- [REFRESH\\_HOSTS](#)  
Flush the host cache, like [FLUSH HOSTS](#).
- [REFRESH\\_STATUS](#)  
Reset status variables, like [FLUSH STATUS](#).
- [REFRESH\\_THREADS](#)  
Flush the thread cache.
- [REFRESH\\_SLAVE](#)  
On a slave replication server, reset the master server information and restart the slave, like [RESET SLAVE](#).

- [REFRESH\\_MASTER](#)

On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like [RESET MASTER](#).

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.7.59 `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

#### Description

Asks the MySQL server to reload the grant tables. The connected user must have the [RELOAD](#) privilege.

This function is deprecated. Use [mysql\\_query\(\)](#) to issue an SQL [FLUSH PRIVILEGES](#) statement instead.

### Return Values

Zero for success. Nonzero if an error occurred.

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.7.60 `mysql_reset_connection()`

```
int mysql_reset_connection(MYSQL *mysql)
```

## Description

Resets the connection to clear the session state.

`mysql_reset_connection()` has effects similar to `mysql_change_user()` or an auto-reconnect except that the connection is not closed and reopened, and reauthentication is not done. See [Section 27.8.7.3, “mysql\\_change\\_user\(\)”](#) and see [Section 27.8.20, “C API Automatic Reconnection Control”](#)).

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.
- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.

## Return Values

Zero for success. Nonzero if an error occurred.

### 27.8.7.61 mysql\_rollback()

```
my_bool mysql_rollback(MYSQL *mysql)
```

## Description

Rolls back the current transaction.

The action of this function is subject to the value of the `completion_type` system variable. In particular, if the value of `completion_type` is `RELEASE` (or 2), the server performs a release after terminating a transaction and closes the client connection. Call `mysql_close()` from the client program to close the connection from the client side.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

None.

### 27.8.7.62 mysql\_row\_seek()

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET offset)
```

## Description

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset, typically a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

## Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

## Errors

None.

### 27.8.7.63 `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

## Description

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

Use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

## Return Values

The current offset of the row cursor.

## Errors

None.

### 27.8.7.64 `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

## Description

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that include no explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 27.8.7.65 `mysql_session_track_get_first()`

```
int mysql_session_track_get_first(MYSQL *mysql, enum enum_session_state_type
type, const char **data, size_t *length)
```

#### Description

MySQL implements a session tracker mechanism whereby the server returns information about session state changes to clients. To control which notifications the server provides about state changes, client applications set system variables having names of the form `session_track_xxx`, such as `session_track_state_change`, `session_track_schema`, and `session_track_system_variables`. See [Section 5.1.13](#), “Server Tracking of Client Session State Changes”.

Change notification occurs in the MySQL client/server protocol, which includes tracker information in OK packets so that session state changes can be detected. To enable client applications to extract state-change information from OK packets, the MySQL C API provides a pair of functions:

- `mysql_session_track_get_first()` fetches the first part of the state-change information received from the server.
- `mysql_session_track_get_next()` fetches any remaining state-change information received from the server. Following a successful call to `mysql_session_track_get_first()`, call this function repeatedly as long as it returns success.

The `mysql_session_track_get_first()` parameters are used as follows. These descriptions also apply to `mysql_session_track_get_next()`, which takes the same parameters.

- `mysql`: The connection handler.
- `type`: The tracker type indicating what kind of information to retrieve. Permitted tracker values are the members of the `enum_session_state_type` enumeration defined in `mysql_com.h`:

```
enum enum_session_state_type
{
    SESSION_TRACK_SYSTEM_VARIABLES,          /* Session system variables */
    SESSION_TRACK_SCHEMA,                    /* Current schema */
    SESSION_TRACK_STATE_CHANGE,               /* Session state changes */
    SESSION_TRACK_GTIDS,                     /* GTIDs */
    SESSION_TRACK_TRANSACTION_CHARACTERISTICS, /* Transaction characteristics */
    SESSION_TRACK_TRANSACTION_STATE          /* Transaction state */
};
```

The members of that enumeration may change over time as MySQL implements additional session-information trackers. To make it easy for applications to loop over all possible tracker types regardless of the number of members, the `SESSION_TRACK_BEGIN` and `SESSION_TRACK_END` symbols are defined to be equal to the first and last members of the `enum_session_state_type` enumeration. The example code shown later in this section demonstrates this technique. (Of course, if the enumeration members change, you must recompile your application to enable it to take account of new trackers.)

- `data`: The address of a `const char *` variable. Following a successful call, this variable points to the returned data, which should be considered read only.
- `length`: The address of a `size_t` variable. Following a successful call, this variable contains the length of the data pointed to by the `data` parameter.

The following discussion describes how to interpret the `data` and `length` values according to the `type` value. It also indicates which system variable enables notifications for each tracker type.

- `SESSION_TRACK_SCHEMA`: This tracker type indicates that the default schema has been set. `data` is a string containing the new default schema name. `length` is the string length.

To enable notifications for this tracker type, enable the `session_track_schema` system variable.

- `SESSION_TRACK_SYSTEM_VARIABLES`: This tracker type indicates that one or more tracked session system variables have been assigned a value. When a session system variable is assigned, two values per variable are returned (in separate calls). For the first call, `data` is a string containing the variable name and `length` is the string length. For the second call, `data` is a string containing the variable value and `length` is the string length.

By default, notification is enabled for `time_zone`, `autocommit`, `character_set_client`, `character_set_results`, and `character_set_connection`. To change the default notification for this tracker type, set the `session_track_schema` system variable to a comma-separated list of variables for which to track changes, or `*` to track changes for all variables. To disable notification of session variable assignments, set `session_track_system_variables` to the empty string.

- `SESSION_TRACK_STATE_CHANGE`: This tracker type indicates a change to some tracked attribute of session state. `data` is a byte containing a boolean flag that indicates whether session state changes occurred. `length` should be 1. The flag is represented as an ASCII value, not a binary (for example, `'1'`, not `0x01`).

To enable notifications for this tracker type, enable the `session_track_state_change` system variable.

This tracker reports changes for these attributes of session state:

- The default schema (database).
- Session-specific values for system variables.
- User-defined variables.
- Temporary tables.
- Prepared statements.
- `SESSION_TRACK_GTIDS`: This tracker type indicates that GTIDS are available. `data` contains encoded GTID data, `length` indicates the data length. Once the `data` value has been extracted, it must be further interpreted into three parts: Encoding specification, length of GTIDs string, GTIDs string. Currently, there is only one encoding specification, so this should always be 0. The GTIDs string is in the standard format for specifying a set of GTID values; see [GTID Sets](#).

To enable notifications for this tracker type, set the `session_track_gtids` system variable.

- `SESSION_TRACK_TRANSACTION_CHARACTERISTICS`: This tracker type indicates that transaction characteristics are available. `data` is a string containing the characteristics data. `length` is the string length. The characteristics tracker data string may be empty, or it may contain one or more SQL statements, each terminated by a semicolon:
  - If no characteristics apply, the string is empty.

- If a transaction was explicitly started, the string contains the statement or statements required to restart the transaction with the same characteristics. As a general rule, this is a `START TRANSACTION` statement (possibly with one or more of `READ ONLY`, `READ WRITE`, and `WITH CONSISTENT SNAPSHOT`). If any characteristics apply that cannot be passed to `START TRANSACTION`, such as `ISOLATION LEVEL`, a suitable `SET TRANSACTION` statement is prepended (for example, `SET TRANSACTION ISOLATION LEVEL SERIALIZABLE; START TRANSACTION READ WRITE;`).
- If a transaction was not explicitly started, but one-shot characteristics that apply only to the next transaction were set up, a `SET TRANSACTION` statement suitable for replicating that setup is generated (for example, `SET TRANSACTION READ ONLY;`).

To enable notifications for this tracker type, set the `session_track_transaction_info` system variable to `CHARACTERISTICS` (which also enables the `SESSION_TRACK_TRANSACTION_STATE` tracker type).

Transaction characteristics tracking enables the client determine how to restart a transaction in another session so it has the same characteristics as in the original session.

Because characteristics may be set using `SET TRANSACTION` before a transaction is started, it is not safe for the client to assume that there are no transaction characteristics if no transaction is active. It is therefore unsafe not to track transaction characteristics and just switch the connection when no transaction is active (whether this is detected by the transaction state tracker or the traditional `SERVER_STATUS_IN_TRANS` flag). A client *must* subscribe to the transaction characteristics tracker if it may wish to switch its session to another connection at some point and transactions may be used.

In addition, the client must track the `transaction_read_only` and `transaction_isolation` system variables to correctly determine the session defaults. (To track these variables, list them in the value of the `session_track_system_variables` system variable.)

- `SESSION_TRACK_TRANSACTION_STATE`: This tracker type indicates that transaction state information is available. `data` is a string containing ASCII characters, each of which indicates some aspect of the transaction state. `length` is the string length (always 8).

To enable notifications for this tracker type, set the `session_track_transaction_info` system variable to `STATE`.

Transaction state tracking enables the client to determine whether a transaction is in progress and whether it could be moved to a different session without being rolled back.

The scope of the tracker item is the transaction. All state-indicating flags persist until the transaction is committed or rolled back. As statements are added to the transaction, additional flags may be set in successive tracker data values. However, no flags are cleared until the transaction ends.

Transaction state is reported as a string containing a sequence of ASCII characters. Each active state has a unique character assigned to it as well as a fixed position in the sequence. The following list describes the permitted values for positions 1 through 8 of the sequence:

- Position 1: Whether an active transaction is ongoing.
  - `T`: An explicitly started transaction is ongoing.
  - `I`: An implicitly started transaction (`autocommit=0`) is ongoing.
  - `_`: There is no active transaction.
- Position 2: Whether nontransactional tables were read in the context of the current transaction.
  - `r`: One or more nontransactional tables were read.

- `_`: No nontransactional tables were read so far.
- Position 3: Whether transactional tables were read in the context of the current transaction.
  - `R`: One or more transactional tables were read.
  - `_`: No transactional tables were read so far.
- Position 4: Whether unsafe writes (writes to nontransactional tables) were performed in the context of the current transaction.
  - `w`: One or more nontransactional tables were written.
  - `_`: No nontransactional tables were written so far.
- Position 5: Whether any transactional tables were written in the context of the current transaction.
  - `W`: One or more transactional tables were written.
  - `_`: No transactional tables were written so far.
- Position 6: Whether any unsafe statements were executed in the context of the current transaction. Statements containing nondeterministic constructs such as `RAND()` or `UUID()` are unsafe for statement-based replication.
  - `s`: One or more unsafe statements were executed.
  - `_`: No unsafe statements were executed so far.
- Position 7: Whether a result set was sent to the client during the current transaction.
  - `S`: A result set was sent.
  - `_`: No result sets were sent so far.
- Position 8: Whether a `LOCK TABLES` statement is in effect.
  - `L`: Tables are explicitly locked with `LOCK TABLES`.
  - `_`: `LOCK TABLES` is not active in the session.

Consider a session consisting of the following statements, including one to enable the transaction state tracker:

```
1. SET @@session.session_track_transaction_info='STATE';
2. START TRANSACTION;
3. SELECT 1;
4. INSERT INTO t1 () VALUES();
5. INSERT INTO t1 () VALUES(1, RAND());
6. COMMIT;
```

With transaction state tracking enabled, the following `data` values result from those statements:

```
1. _____
2. T_____
3. T_____S_
4. T_____W_S_
5. T_____WsS_
6. _____
```

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

None.

## Example

The following example shows how to call `mysql_session_track_get_first()` and `mysql_session_track_get_next()` to retrieve and display all available session state-change information following successful execution of an SQL statement string (represented by `stmt_str`). It is assumed that the application has set the `session_track_XXX` system variables that enable the notifications it wishes to receive.

```
printf("Execute: %s\n", stmt_str);

if (mysql_query(mysql, stmt_str) != 0)
{
    fprintf(stderr, "Error %u: %s\n",
            mysql_errno(mysql), mysql_error(mysql));
    return;
}

MYSQL_RES *result = mysql_store_result(mysql);
if (result) /* there is a result set to fetch */
{
    /* ... process rows here ... */
    printf("Number of rows returned: %lu\n",
           (unsigned long) mysql_num_rows(result));
    mysql_free_result(result);
}
else /* there is no result set */
{
    if (mysql_field_count(mysql) == 0)
    {
        printf("Number of rows affected: %lu\n",
               (unsigned long) mysql_affected_rows(mysql));
    }
    else /* an error occurred */
    {
        fprintf(stderr, "Error %u: %s\n",
                mysql_errno(mysql), mysql_error(mysql));
    }
}

/* extract any available session state-change information */
enum enum_session_state_type type;
for (type = SESSION_TRACK_BEGIN; type <= SESSION_TRACK_END; type++)
{
    const char *data;
    size_t length;

    if (mysql_session_track_get_first(mysql, type, &data, &length) == 0)
    {
        /* print info type and initial data */
        printf("Type=%d:\n", type);
        printf("mysql_session_track_get_first(): length=%d; data=%*.s\n",
               (int) length, (int) length, (int) length, data);

        /* check for more data */
        while (mysql_session_track_get_next(mysql, type, &data, &length) == 0)
        {
            printf("mysql_session_track_get_next(): length=%d; data=%*.s\n",
                   (int) length, (int) length, (int) length, data);
        }
    }
}
```

### 27.8.7.66 `mysql_session_track_get_next()`

```
int mysql_session_track_get_next(MYSQL *mysql, enum enum_session_state_type
type, const char **data, size_t *length)
```

#### Description

This function fetches additional session state-change information received from the server, following that retrieved by `mysql_session_track_get_first()`. The parameters for `mysql_session_track_get_next()` are the same as for `mysql_session_track_get_first()`.

Following a successful call to `mysql_session_track_get_first()`, call `mysql_session_track_get_next()` repeatedly until it returns nonzero to indicate no more information is available. The calling sequence for `mysql_session_track_get_next()` is similar to that for `mysql_session_track_get_first()`. For more information and an example that demonstrates both functions, see [Section 27.8.7.65](#), “`mysql_session_track_get_first()`”.

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

None.

### 27.8.7.67 `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, const char *csname)
```

#### Description

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`.

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n",
            mysql_character_set_name(&mysql));
}
```

### 27.8.7.68 `mysql_set_local_infile_default()`

```
void mysql_set_local_infile_default(MYSQL *mysql);
```

## Description

Sets the `LOAD DATA LOCAL INFILE` callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

## Return Values

None.

## Errors

None.

### 27.8.7.69 `mysql_set_local_infile_handler()`

```
void mysql_set_local_infile_handler(MYSQL *mysql, int (*local_infile_init)
(void **, const char *, void *), int (*local_infile_read)(void *, char *,
unsigned int), void (*local_infile_end)(void *), int (*local_infile_error)
(void *, char*, unsigned int), void *userdata);
```

## Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) data file reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the data file, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

Make the initialization function return zero for success, nonzero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data is stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. Within this function, deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr,
                  char *error_msg,
                  unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message is written, and `error_msg_len` is the length of the buffer. Write the message as a null-terminated string, at most `error_msg_len-1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The file name specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

## Return Values

None.

## Errors

None.

### 27.8.7.70 `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

## Description

Enables or disables an option for the connection. `option` can have one of the following values.

Option	Description
<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`. If you are using the `CALL` SQL statement in your programs, multiple-result support must be enabled; this means that `MYSQL_OPTION_MULTI_STATEMENTS_ON` by itself is insufficient to permit the use of `CALL`.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [ER\\_UNKNOWN\\_COM\\_ERROR](#)

The server did not support [mysql\\_set\\_server\\_option\(\)](#) (which is the case that the server is older than 4.1.1) or the server did not support the option one tried to set.

### 27.8.7.71 [mysql\\_shutdown\(\)](#)

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level
shutdown_level)
```

#### Description

#### Note

[mysql\\_shutdown\(\)](#) is deprecated and will be removed in a future version of MySQL. Instead, use [mysql\\_query\(\)](#) to execute a [SHUTDOWN](#) statement.

Asks the database server to shut down. The connected user must have the [SHUTDOWN](#) privilege. MySQL servers support only one type of shutdown; [shutdown\\_level](#) must be equal to [SHUTDOWN\\_DEFAULT](#). Dynamically linked executables which have been compiled with older versions of the [libmysqlclient](#) headers and call [mysql\\_shutdown\(\)](#) need to be used with the old [libmysqlclient](#) dynamic library.

An alternative to [mysql\\_shutdown\(\)](#) is to use the [SHUTDOWN](#) SQL statement.

The shutdown process is described in [Section 5.1.16, “The Server Shutdown Process”](#).

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.7.72 [mysql\\_sqlstate\(\)](#)

```
const char *mysql_sqlstate(MYSQL *mysql)
```

#### Description

Returns a null-terminated string containing the SQLSTATE error code for the most recently executed SQL statement. The error code consists of five characters. '00000' means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value 'HY000' (general error) is used for unmapped error numbers.

If you call `mysql_sqlstate()` after `mysql_real_connect()` fails, `mysql_sqlstate()` might not return a useful value. For example, this happens if a host is blocked by the server and the connection is closed without any SQLSTATE value being sent to the client.

## Return Values

A null-terminated character string containing the SQLSTATE error code.

## See Also

See [Section 27.8.7.14, “mysql\\_errno\(\)”](#), [Section 27.8.7.15, “mysql\\_error\(\)”](#), and [Section 27.8.11.27, “mysql\\_stmt\\_sqlstate\(\)”](#).

### 27.8.7.73 mysql\_ssl\_set()

```
my_bool mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert, const
char *ca, const char *capath, const char *cipher)
```

## Description

`mysql_ssl_set()` is used for establishing encrypted connections using SSL. The `mysql` argument must be a valid connection handler. Any unused SSL arguments may be given as `NULL`.

If used, `mysql_ssl_set()` must be called before `mysql_real_connect()`. `mysql_ssl_set()` does nothing unless SSL support is enabled in the client library.

It is optional to call `mysql_ssl_set()` to obtain an encrypted connection because by default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see [Section 6.4.1, “Configuring MySQL to Use Encrypted Connections”](#)). `mysql_ssl_set()` may be useful to applications that must specify particular certificate and key files, encryption ciphers, and so forth.

`mysql_ssl_set()` specifies SSL information such as certificate and key files for establishing an encrypted connection if such connections are available, but does not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the technique described in [Section 27.8.15, “C API Encrypted Connection Support”](#).

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended. For details, see [Section 27.8.15, “C API Encrypted Connection Support”](#).

`mysql_ssl_set()` is a convenience function that is essentially equivalent to this set of `mysql_options()` calls:

```
mysql_options(mysql, MYSQL_OPT_SSL_KEY, key);
mysql_options(mysql, MYSQL_OPT_SSL_CERT, cert);
mysql_options(mysql, MYSQL_OPT_SSL_CA, ca);
mysql_options(mysql, MYSQL_OPT_SSL_CAPATH, capath);
```

```
mysql_options(mysql, MYSQL_OPT_SSL_CIPHER, cipher);
```

Because of that equivalence, applications can, instead of calling `mysql_ssl_set()`, call `mysql_options()` directly, omitting calls for those options for which the option value is `NULL`. Moreover, `mysql_options()` offers encrypted-connection options not available using `mysql_ssl_set()`, such as `MYSQL_OPT_SSL_MODE` to specify the security state of the connection, and `MYSQL_OPT_TLS_VERSION` to specify the protocols permitted by the client for encrypted connections.

Arguments:

- `mysql`: The connection handler returned from `mysql_init()`.
- `key`: The path name of the client private key file.
- `cert`: The path name of the client public key certificate file.
- `ca`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.
- `capath`: The path name of the directory that contains trusted SSL CA certificate files.
- `cipher`: The list of permitted ciphers for SSL encryption.

## Return Values

This function always returns `0`. If SSL setup is incorrect, a subsequent `mysql_real_connect()` call returns an error when you attempt to connect.

### 27.8.7.74 `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

## Description

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

## Return Values

A character string describing the server status. `NULL` if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 27.8.7.75 `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

## Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

You need not call `mysql_store_result()` or `mysql_use_result()` for other statements, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect whether the statement has a result set by checking whether `mysql_store_result()` returns a nonzero value (more about this later).

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 27.8.16, “C API Multiple Statement Execution Support”](#).

If you want to know whether a statement should return a result set, you can use `mysql_field_count()` to check for this. See [Section 27.8.7.22, “mysql\\_field\\_count\(\)”](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the statement did not return a result set (for example, if it was an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking whether `mysql_error()` returns a nonempty string, `mysql_errno()` returns nonzero, or `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

After you have called `mysql_store_result()` and gotten back a result that is not a null pointer, you can call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

See [Section 27.8.21.1, “Why mysql\\_store\\_result\(\) Sometimes Returns NULL After mysql\\_query\(\) Returns Success”](#).

## Return Values

A `MYSQL_RES` result structure with the results. `NULL` (0) if an error occurred.

## Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 27.8.7.76 `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

#### Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

#### Note

This function does not work correctly if thread IDs become larger than 32 bits, which can occur on some systems. To avoid problems with `mysql_thread_id()`, do not use it. To get the connection ID, execute a `SELECT CONNECTION_ID()` query and retrieve the result.

#### Return Values

The thread ID of the current connection.

#### Errors

None.

### 27.8.7.77 `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

#### Description

After invoking `mysql_query()` or `mysql_real_query()`, you must call `mysql_store_result()` or `mysql_use_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth). You must also call `mysql_free_result()` after you are done with the result set.

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by making calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you should not use `mysql_use_result()` for locking reads if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a `^S` (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from

`mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

## Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

## Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 27.8.7.78 `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

## Description

Returns the number of errors, warnings, and notes generated during execution of the previous SQL statement.

## Return Values

The warning count.

## Errors

None.

## 27.8.8 C API Prepared Statements

The MySQL client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handler returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time

it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and nonprepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

For a list of SQL statements that can be used as prepared statements, see [Section 13.5, “Prepared SQL Statement Syntax”](#).

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 8.10.4, “Caching of Prepared Statements and Stored Programs”](#).

## 27.8.9 C API Prepared Statement Data Structures

Prepared statements use several data structures:

- To obtain a statement handler, pass a `MYSQL` connection handler to `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT` data structure. This structure is used for further operations with the statement. To specify the statement to prepare, pass the `MYSQL_STMT` pointer and the statement string to `mysql_stmt_prepare()`.
- To provide input parameters for a prepared statement, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_param()`. To receive output column values, set up `MYSQL_BIND` structures and pass them to `mysql_stmt_bind_result()`.
- The `MYSQL_TIME` structure is used to transfer temporal data in both directions.

The following discussion describes the prepared statement data types in detail. For examples that show how to use them, see [Section 27.8.11.10, “mysql\\_stmt\\_execute\(\)”](#), and [Section 27.8.11.11, “mysql\\_stmt\\_fetch\(\)”](#).

- `MYSQL_STMT`

This structure is a handler for a prepared statement. A handler is created by calling `mysql_stmt_init()`, which returns a pointer to a `MYSQL_STMT`. The handler is used for all subsequent operations with the statement until you close it with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

The `MYSQL_STMT` structure has no members intended for application use. Applications should not try to copy a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handlers can be associated with a single connection. The limit on the number of handlers depends on the available system resources.

- `MYSQL_BIND`

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server):

- For input, use `MYSQL_BIND` structures with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`.
- For output, use `MYSQL_BIND` structures with `mysql_stmt_bind_result()` to bind buffers to result set columns, for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, zero its contents to initialize it, then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. For several of the members, the manner of use depends on whether the structure is used for input or output.

- `enum enum_field_types buffer_type`

The type of the buffer. This member indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored. For permissible `buffer_type` values, see [Section 27.8.9.1, “C API Prepared Statement Type Codes”](#).

- `void *buffer`

A pointer to the buffer to be used for data transfer. This is the address of a C language variable.

For input, `buffer` is a pointer to the variable in which you store the data value for a statement parameter. When you call `mysql_stmt_execute()`, MySQL use the value stored in the variable in place of the corresponding parameter marker in the statement (specified with `?` in the statement string).

For output, `buffer` is a pointer to the variable in which to return a result set column value. When you call `mysql_stmt_fetch()`, MySQL stores a column value from the current row of the result set in this variable. You can access the value when the call returns.

To minimize the need for MySQL to perform type conversions between C language values on the client side and SQL values on the server side, use C variables that have types similar to those of the corresponding SQL values:

- For numeric data types, `buffer` should point to a variable of the proper numeric C type. For integer variables (which can be `char` for single-byte values or an integer type for larger values), you should also indicate whether the variable has the `unsigned` attribute by setting the `is_unsigned` member, described later.
- For character (nonbinary) and binary string data types, `buffer` should point to a character buffer.
- For date and time data types, `buffer` should point to a `MYSQL_TIME` structure.

For guidelines about mapping between C types and SQL types and notes about type conversions, see [Section 27.8.9.1, “C API Prepared Statement Type Codes”](#), and [Section 27.8.9.2, “C API Prepared Statement Type Conversions”](#).

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()` to specify input values, or the maximum number of output data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data.

For input parameter data binding, set `*length` to indicate the actual length of the parameter value stored in `*buffer`. This is used by `mysql_stmt_execute()`.

For output value binding, MySQL sets `*length` when you call `mysql_stmt_fetch()`. The `mysql_stmt_fetch()` return value determines how to interpret the length:

- If the return value is 0, `*length` indicates the actual length of the parameter value.
- If the return value is `MYSQL_DATA_TRUNCATED`, `*length` indicates the nontruncated length of the parameter value. In this case, the minimum of `*length` and `buffer_length` indicates the actual length of the value.

`length` is ignored for numeric and temporal data types because the `buffer_type` value determines the length of the data value.

If you must determine the length of a returned value before fetching it, see [Section 27.8.11.11](#), “`mysql_stmt_fetch()`”, for some strategies.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter.

`is_null` is a *pointer* to a boolean scalar, not a boolean scalar, to provide flexibility in how you specify `NULL` values:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` as the `buffer_type` value when you bind the column. The other `MYSQL_BIND` members, including `is_null`, do not matter.
- If your data values are always `NOT NULL`, set `is_null = (my_bool*) 0`, and set the other members appropriately for the variable you are binding.
- In all other cases, set the other members appropriately and set `is_null` to the address of a `my_bool` variable. Set that variable's value to true or false appropriately between executions to indicate whether the corresponding data value is `NULL` or `NOT NULL`, respectively.

For output, when you fetch a row, MySQL sets the value pointed to by `is_null` to true or false according to whether the result set column value returned from the statement is or is not `NULL`.

- `my_bool is_unsigned`

This member applies for C variables with data types that can be `unsigned` (`char`, `short int`, `int`, `long long int`). Set `is_unsigned` to true if the variable pointed to by `buffer` is `unsigned` and false otherwise. For example, if you bind a `signed char` variable to `buffer`, specify a type code of `MYSQL_TYPE_TINY` and set `is_unsigned` to false. If you bind an `unsigned char` instead, the type code is the same but `is_unsigned` should be true. (For `char`, it is not defined whether it is signed or unsigned, so it is best to be explicit about signedness by using `signed char` or `unsigned char`.)

`is_unsigned` applies only to the C language variable on the client side. It indicates nothing about the signedness of the corresponding SQL value on the server side. For example, if you use an `int` variable to supply a value for a `BIGINT UNSIGNED` column, `is_unsigned` should be false because `int` is a signed type. If you use an `unsigned int` variable to supply a value for a `BIGINT` column, `is_unsigned` should be true because `unsigned int` is an unsigned type. MySQL performs the proper conversion between signed and unsigned values in both directions, although a warning occurs if truncation results.

- `my_bool *error`

For output, set this member to point to a `my_bool` variable to have truncation information for the parameter stored there after a row fetching operation. When truncation reporting is enabled, `mysql_stmt_fetch()` returns `MYSQL_DATA_TRUNCATED` and `*error` is true in the `MYSQL_BIND` structures for parameters in which truncation occurred. Truncation indicates loss of sign or significant digits, or that a string was too long to fit in a column. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. Set the `buffer` member to point to a `MYSQL_TIME` structure, and set the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types (`MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATE`, `MYSQL_TYPE_DATETIME`, `MYSQL_TYPE_TIMESTAMP`).

The `MYSQL_TIME` structure contains the members listed in the following table.

Member	Description
<code>unsigned int year</code>	The year
<code>unsigned int month</code>	The month of the year
<code>unsigned int day</code>	The day of the month
<code>unsigned int hour</code>	The hour of the day
<code>unsigned int minute</code>	The minute of the hour
<code>unsigned int second</code>	The second of the minute
<code>my_bool neg</code>	A boolean flag indicating whether the time is negative
<code>unsigned long second_part</code>	The fractional part of the second in microseconds

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used. The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 27.8.17, “C API Prepared Statement Handling of Date and Time Values”](#).

### 27.8.9.1 C API Prepared Statement Type Codes

The `buffer_type` member of `MYSQL_BIND` structures indicates the data type of the C language variable bound to a statement parameter or result set column. For input, `buffer_type` indicates the type of the variable containing the value to be sent to the server. For output, it indicates the type of the variable into which a value received from the server should be stored.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for input values sent to the server. The table shows the C variable types that you can use, the corresponding type codes, and the SQL data types for which the supplied value can be used without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

Input Variable C Type	<code>buffer_type</code> Value	SQL Type of Destination Value
<code>signed char</code>	<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>
<code>short int</code>	<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>
<code>int</code>	<code>MYSQL_TYPE_LONG</code>	<code>INT</code>
<code>long long int</code>	<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>
<code>float</code>	<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>
<code>double</code>	<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>

Input Variable C Type	<code>buffer_type</code> Value	SQL Type of Destination Value
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIME</code>	TIME
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATE</code>	DATE
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_DATETIME</code>	DATETIME
<code>MYSQL_TIME</code>	<code>MYSQL_TYPE_TIMESTAMP</code>	TIMESTAMP
<code>char[ ]</code>	<code>MYSQL_TYPE_STRING</code>	TEXT, CHAR, VARCHAR
<code>char[ ]</code>	<code>MYSQL_TYPE_BLOB</code>	BLOB, BINARY, VARBINARY
	<code>MYSQL_TYPE_NULL</code>	NULL

Use `MYSQL_TYPE_NULL` as indicated in the description for the `is_null` member in [Section 27.8.9, “C API Prepared Statement Data Structures”](#).

For input string data, use `MYSQL_TYPE_STRING` or `MYSQL_TYPE_BLOB` depending on whether the value is a character (nonbinary) or binary string:

- `MYSQL_TYPE_STRING` indicates character input string data. The value is assumed to be in the character set indicated by the `character_set_client` system variable. If the server stores the value into a column with a different character set, it converts the value to that character set.
- `MYSQL_TYPE_BLOB` indicates binary input string data. The value is treated as having the `binary` character set. That is, it is treated as a byte string and no conversion occurs.

The following table shows the permissible values for the `buffer_type` member of `MYSQL_BIND` structures for output values received from the server. The table shows the SQL types of received values, the corresponding type codes that such values have in result set metadata, and the recommended C language data types to bind to the `MYSQL_BIND` structure to receive the SQL values without conversion. Choose the `buffer_type` value according to the data type of the C language variable that you are binding. For the integer types, you should also set the `is_unsigned` member to indicate whether the variable is signed or unsigned.

SQL Type of Received Value	<code>buffer_type</code> Value	Output Variable C Type
TINYINT	<code>MYSQL_TYPE_TINY</code>	signed char
SMALLINT	<code>MYSQL_TYPE_SHORT</code>	short int
MEDIUMINT	<code>MYSQL_TYPE_INT24</code>	int
INT	<code>MYSQL_TYPE_LONG</code>	int
BIGINT	<code>MYSQL_TYPE_LONGLONG</code>	long long int
FLOAT	<code>MYSQL_TYPE_FLOAT</code>	float
DOUBLE	<code>MYSQL_TYPE_DOUBLE</code>	double
DECIMAL	<code>MYSQL_TYPE_NEWDECIMAL</code>	char[ ]
YEAR	<code>MYSQL_TYPE_SHORT</code>	short int
TIME	<code>MYSQL_TYPE_TIME</code>	<code>MYSQL_TIME</code>
DATE	<code>MYSQL_TYPE_DATE</code>	<code>MYSQL_TIME</code>
DATETIME	<code>MYSQL_TYPE_DATETIME</code>	<code>MYSQL_TIME</code>
TIMESTAMP	<code>MYSQL_TYPE_TIMESTAMP</code>	<code>MYSQL_TIME</code>
CHAR, BINARY	<code>MYSQL_TYPE_STRING</code>	char[ ]
VARCHAR, VARBINARY	<code>MYSQL_TYPE_VAR_STRING</code>	char[ ]
TINYBLOB, TINYTEXT	<code>MYSQL_TYPE_TINY_BLOB</code>	char[ ]
BLOB, TEXT	<code>MYSQL_TYPE_BLOB</code>	char[ ]
MEDIUMBLOB, MEDIUMTEXT	<code>MYSQL_TYPE_MEDIUM_BLOB</code>	char[ ]

SQL Type of Received Value	buffer_type Value	Output Variable C Type
LOBLOB, LONGTEXT	MYSQL_TYPE_LONG_BLOB	char[ ]
BIT	MYSQL_TYPE_BIT	char[ ]

### 27.8.9.2 C API Prepared Statement Type Conversions

Prepared statements transmit data between the client and server using C language variables on the client side that correspond to SQL values on the server side. If there is a mismatch between the C variable type on the client side and the corresponding SQL value type on the server side, MySQL performs implicit type conversions in both directions.

MySQL knows the type code for the SQL value on the server side. The `buffer_type` value in the `MYSQL_BIND` structure indicates the type code of the C variable that holds the value on the client side. The two codes together tell MySQL what conversion must be performed, if any. Here are some examples:

- If you use `MYSQL_TYPE_LONG` with an `int` variable to pass an integer value to the server that is to be stored into a `FLOAT` column, MySQL converts the value to floating-point format before storing it.
- If you fetch an SQL `MEDIUMINT` column value, but specify a `buffer_type` value of `MYSQL_TYPE_LONGLONG` and use a C variable of type `long long int` as the destination buffer, MySQL converts the `MEDIUMINT` value (which requires less than 8 bytes) for storage into the `long long int` (an 8-byte variable).
- If you fetch a numeric column with a value of 255 into a `char[4]` character array and specify a `buffer_type` value of `MYSQL_TYPE_STRING`, the resulting value in the array is a 4-byte string `'255\0'`.
- MySQL returns `DECIMAL` values as the string representation of the original server-side value, which is why the corresponding C type is `char[ ]`. For example, `12.345` is returned to the client as `'12.345'`. If you specify `MYSQL_TYPE_NEWDECIMAL` and bind a string buffer to the `MYSQL_BIND` structure, `mysql_stmt_fetch()` stores the value in the buffer as a string without conversion. If instead you specify a numeric variable and type code, `mysql_stmt_fetch()` converts the string-format `DECIMAL` value to numeric form.
- For the `MYSQL_TYPE_BIT` type code, `BIT` values are returned into a string buffer, which is why the corresponding C type is `char[ ]`. The value represents a bit string that requires interpretation on the client side. To return the value as a type that is easier to deal with, you can cause the value to be cast to integer using either of the following types of expressions:

```
SELECT bit_col + 0 FROM t
SELECT CAST(bit_col AS UNSIGNED) FROM t
```

To retrieve the value, bind an integer variable large enough to hold the value and specify the appropriate corresponding integer type code.

Before binding variables to the `MYSQL_BIND` structures that are to be used for fetching column values, you can check the type codes for each column of the result set. This might be desirable if you want to determine which variable types would be best to use to avoid type conversions. To get the type codes, call `mysql_stmt_result_metadata()` after executing the prepared statement with `mysql_stmt_execute()`. The metadata provides access to the type codes for the result set as described in [Section 27.8.11.23, “mysql\\_stmt\\_result\\_metadata\(\)”](#), and [Section 27.8.5, “C API Data Structures”](#).

To determine whether output string values in a result set returned from the server contain binary or nonbinary data, check whether the `charsetnr` value of the result set metadata is 63 (see [Section 27.8.5, “C API Data Structures”](#)). If so, the character set is `binary`, which indicates binary rather than nonbinary data. This enables you to distinguish `BINARY` from `CHAR`, `VARBINARY` from `VARCHAR`, and the `BLOB` types from the `TEXT` types.

If you cause the `max_length` member of the `MYSQL_FIELD` column metadata structures to be set (by calling `mysql_stmt_attr_set()`), be aware that the `max_length` values for the result set indicate the lengths of the longest string representation of the result values, not the lengths of the binary representation. That is, `max_length` does not necessarily correspond to the size of the buffers needed to fetch the values with the binary protocol used for prepared statements. Choose the size of the buffers according to the types of the variables into which you fetch the values. For example, a `TINYINT` column containing the value -128 might have a `max_length` value of 4. But the binary representation of any `TINYINT` value requires only 1 byte for storage, so you can supply a `signed char` variable in which to store the value and set `is_unsigned` to indicate that values are signed.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 8.10.4, “Caching of Prepared Statements and Stored Programs”](#).

## 27.8.10 C API Prepared Statement Function Overview

The following list summarizes the functions available for prepared statement processing. For greater detail, see the descriptions in [Section 27.8.11, “C API Prepared Statement Function Descriptions”](#).

- `mysql_stmt_affected_rows()`: Returns the number of rows changed, deleted, or inserted by prepared `UPDATE`, `DELETE`, or `INSERT` statement
- `mysql_stmt_attr_get()`: Gets value of an attribute for a prepared statement
- `mysql_stmt_attr_set()`: Sets an attribute for a prepared statement
- `mysql_stmt_bind_param()`: Associates application data buffers with the parameter markers in a prepared SQL statement
- `mysql_stmt_bind_result()`: Associates application data buffers with columns in a result set
- `mysql_stmt_close()`: Frees memory used by a prepared statement
- `mysql_stmt_data_seek()`: Seeks to an arbitrary row number in a statement result set
- `mysql_stmt_errno()`: Returns the error number for the last statement execution
- `mysql_stmt_error()`: Returns the error message for the last statement execution
- `mysql_stmt_execute()`: Executes a prepared statement
- `mysql_stmt_fetch()`: Fetches the next row of data from a result set and returns data for all bound columns
- `mysql_stmt_fetch_column()`: Fetch data for one column of the current row of a result set
- `mysql_stmt_field_count()`: Returns the number of result columns for the most recent statement
- `mysql_stmt_free_result()`: Free the resources allocated to a statement handler
- `mysql_stmt_init()`: Allocates memory for a `MYSQL_STMT` structure and initializes it
- `mysql_stmt_insert_id()`: Returns the ID generated for an `AUTO_INCREMENT` column by a prepared statement
- `mysql_stmt_next_result()`: Returns/initiates the next result in a multiple-result execution
- `mysql_stmt_num_rows()`: Returns the row count from a buffered statement result set
- `mysql_stmt_param_count()`: Returns the number of parameters in a prepared statement
- `mysql_stmt_param_metadata()`: (Return parameter metadata in the form of a result set) This function does nothing

- `mysql_stmt_prepare()`: Prepares an SQL statement string for execution
- `mysql_stmt_reset()`: Resets the statement buffers in the server
- `mysql_stmt_result_metadata()`: Returns prepared statement metadata in the form of a result set
- `mysql_stmt_row_seek()`: Seeks to a row offset in a statement result set, using value returned from `mysql_stmt_row_tell()`
- `mysql_stmt_row_tell()`: Returns the statement row cursor position
- `mysql_stmt_send_long_data()`: Sends long data in chunks to server
- `mysql_stmt_sqlstate()`: Returns the SQLSTATE error code for the last statement execution
- `mysql_stmt_store_result()`: Retrieves a complete result set to the client

Call `mysql_stmt_init()` to create a statement handler, then `mysql_stmt_prepare()` to prepare the statement string, `mysql_stmt_bind_param()` to supply the parameter data, and `mysql_stmt_execute()` to execute the statement. You can repeat the `mysql_stmt_execute()` by changing parameter values in the respective buffers supplied through `mysql_stmt_bind_param()`.

You can send text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 27.8.11.26, “mysql\\_stmt\\_send\\_long\\_data\(\)”](#).

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

When statement execution has been completed, close the statement handler using `mysql_stmt_close()` so that all resources associated with it can be freed. At that point the handler becomes invalid and should no longer be used.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

## Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handler with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement will produce a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.

- Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handler and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and the number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the current row of the result set and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error number, error message, and SQLSTATE code using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

## Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

- Call `mysql_stmt_prepare()` to prepare the statement string `"SELECT ?"`.
- Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
- Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare  [1] SELECT ?
Execute  [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

## 27.8.11 C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions described in detail in the following sections.

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

To create a `MYSQL_STMT` handler, use the `mysql_stmt_init()` function.

### 27.8.11.1 `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

## Description

`mysql_stmt_affected_rows()` may be called immediately after executing a statement with `mysql_stmt_execute()`. It is like `mysql_affected_rows()` but for prepared statements. For a description of what the affected-rows value returned by this function means, See [Section 27.8.7.1](#), “`mysql_affected_rows()`”.

## Errors

None.

## Example

See the Example in [Section 27.8.11.10](#), “`mysql_stmt_execute()`”.

### 27.8.11.2 `mysql_stmt_attr_get()`

```
my_bool mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type
option, void *arg)
```

## Description

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, `arg` should point to the value of the integer.

See [Section 27.8.11.3](#), “`mysql_stmt_attr_set()`”, for a list of options and option types.

## Return Values

Zero for success. Nonzero if `option` is unknown.

## Errors

None.

### 27.8.11.3 `mysql_stmt_attr_set()`

```
my_bool mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type
option, const void *arg)
```

## Description

Can be used to affect behavior for a prepared statement. This function may be called multiple times to set several options.

The `option` argument is the option that you want to set. The `arg` argument is the value for the option. `arg` should point to a variable that is set to the desired attribute value. The variable type is as indicated in the following table.

The following table shows the possible `option` values.

Option	Argument Type	Function
<code>STMT_ATTR_UPDATE_MAX_LENGTH</code>	<code>my_bool *</code>	If set to 1, causes <code>mysql_stmt_store_result()</code> to update the metadata <code>MYSQL_FIELD-&gt;max_length</code> value.
<code>STMT_ATTR_CURSOR_TYPE</code>	<code>unsigned long *</code>	Type of cursor to open for statement when <code>mysql_stmt_execute()</code> is invoked. <code>*arg</code> can be

Option	Argument Type	Function
		<code>CURSOR_TYPE_NO_CURSOR</code> (the default) or <code>CURSOR_TYPE_READ_ONLY</code> .
<code>STMT_ATTR_PREFETCH_ROWS</code>	<code>unsigned long *</code>	Number of rows to fetch from server at a time when using a cursor. <code>*arg</code> can be in the range from 1 to the maximum value of <code>unsigned long</code> . The default is 1.

If you use the `STMT_ATTR_CURSOR_TYPE` option with `CURSOR_TYPE_READ_ONLY`, a cursor is opened for the statement when you invoke `mysql_stmt_execute()`. If there is already an open cursor from a previous `mysql_stmt_execute()` call, it closes the cursor before opening a new one. `mysql_stmt_reset()` also closes any open cursor before preparing the statement for re-execution. `mysql_stmt_free_result()` closes any open cursor.

If you open a cursor for a prepared statement, `mysql_stmt_store_result()` is unnecessary, because that function causes the result set to be buffered on the client side.

## Return Values

Zero for success. Nonzero if `option` is unknown.

## Errors

None.

## Example

The following example opens a cursor for a prepared statement and sets the number of rows to fetch at a time to 5:

```
MYSQL_STMT *stmt;
int rc;
unsigned long type;
unsigned long prefetch_rows = 5;

stmt = mysql_stmt_init(mysql);
type = (unsigned long) CURSOR_TYPE_READ_ONLY;
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_CURSOR_TYPE, (void*) &type);
/* ... check return value ... */
rc = mysql_stmt_attr_set(stmt, STMT_ATTR_PREFETCH_ROWS,
                        (void*) &prefetch_rows);
/* ... check return value ... */
```

### 27.8.11.4 `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

## Description

`mysql_stmt_bind_param()` is used to bind input data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each `?` parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?,?,?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

[Section 27.8.9, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to provide input values.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## Example

See the Example in [Section 27.8.11.10, “mysql\\_stmt\\_execute\(\)”](#).

### 27.8.11.5 mysql\_stmt\_bind\_result()

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

## Description

`mysql_stmt_bind_result()` is used to associate (that is, bind) output columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain one element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the data values, because the protocol does not return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol places data into the newly bound buffers when the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and length of the output buffer into which the value should be stored. [Section 27.8.9, “C API Prepared Statement Data Structures”](#), describes the members of each `MYSQL_BIND` element and how they should be set to receive output values.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is invalid or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## Example

See the Example in [Section 27.8.11.11](#), “`mysql_stmt_fetch()`”.

### 27.8.11.6 `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *stmt)
```

## Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handler pointed to by `stmt`, which at that point becomes invalid and should no longer be used. For a failed `mysql_stmt_close()` call, do not call `mysql_stmt_error()`, or `mysql_stmt_errno()`, or `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()`, `mysql_errno()`, or `mysql_sqlstate()` instead.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## Example

See the Example in [Section 27.8.11.10](#), “`mysql_stmt_execute()`”.

### 27.8.11.7 `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

## Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt)-1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

## Return Values

None.

## Errors

None.

### 27.8.11.8 `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Errors, Error Codes, and Common Problems](#).

If the failed statement API function was `mysql_stmt_close()`, do not call or `mysql_stmt_errno()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_errno()` instead.

#### Return Values

An error code value. Zero if no error occurred.

## Errors

None.

### 27.8.11.9 `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string ("" ) is returned if no error occurred. Either of these two tests can be used to check for an error:

```
if(*mysql_stmt_errno(stmt))
{
    // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_error()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_error()` instead.

The language of the client error messages may be changed by recompiling the MySQL client library. You can choose error messages in several different languages.

#### Return Values

A character string that describes the error. An empty string if no error occurred.

## Errors

None.

### 27.8.11.10 `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

#### Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handler. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

Statement processing following `mysql_stmt_execute()` depends on the type of statement:

- For an `UPDATE`, `DELETE`, or `INSERT`, the number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`.
- For a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 27.8.11.11, “mysql\\_stmt\\_fetch\(\)”](#).

Do not follow invocation of `mysql_stmt_execute()` with a call to `mysql_store_result()` or `mysql_use_result()`. Those functions are not intended for processing results from prepared statements.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 8.10.4, “Caching of Prepared Statements and Stored Programs”](#).

#### Return Values

Zero for success. Nonzero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

#### Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`,

`mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handler. For an example that shows how to retrieve data, see [Section 27.8.11.11, “mysql\\_stmt\\_fetch\(\)”](#).

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                                    col2 VARCHAR(40),\
                                                    col3 SMALLINT,\
                                                    col4 TIMESTAMP)"

#define INSERT_SAMPLE "INSERT INTO \
                        test_table(col1,col2,col3) \
                        VALUES(?,?,?)"

{
    /* mysql_stmt_close() invalidates stmt, so call          */
    /* mysql_error(mysql) rather than mysql_stmt_error(stmt) */
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

```

### Note

For complete examples on the use of prepared statement functions, refer to the file `tests/mysql_client_test.c`. This file can be obtained from a MySQL source distribution or from the source repository (see [Section 2.9, “Installing MySQL from Source”](#)).

#### 27.8.11.11 `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

#### Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` for a statement such as `SELECT` that produces a result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer. All columns must be bound by the application before it calls `mysql_stmt_fetch()`.

By default, result sets are fetched unbuffered a row at a time from the server. To buffer the entire result set on the client, call `mysql_stmt_store_result()` after binding the data buffers and before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains `TRUE` (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4
<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>

Type	Length
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data_length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

In some cases you might want to determine the length of a column value before fetching it with `mysql_stmt_fetch()`. For example, the value might be a long string or `BLOB` value for which you want to know how much space must be allocated. To accomplish this, you can use these strategies:

- Before invoking `mysql_stmt_fetch()` to retrieve individual rows, pass `STMT_ATTR_UPDATE_MAX_LENGTH` to `mysql_stmt_attr_set()`, then invoke `mysql_stmt_store_result()` to buffer the entire result on the client side. Setting the `STMT_ATTR_UPDATE_MAX_LENGTH` attribute causes the maximal length of column values to be indicated by the `max_length` member of the result set metadata returned by `mysql_stmt_result_metadata()`.
- Invoke `mysql_stmt_fetch()` with a zero-length buffer for the column in question and a pointer in which the real length can be stored. Then use the real length with `mysql_stmt_fetch_column()`.

```
real_length= 0;

bind[0].buffer= 0;
bind[0].buffer_length= 0;
bind[0].length= &real_length;
mysql_stmt_bind_result(stmt, bind);

mysql_stmt_fetch(stmt);
if (real_length > 0)
{
    data= malloc(real_length);
    bind[0].buffer= data;
    bind[0].buffer_length= real_length;
    mysql_stmt_fetch_column(stmt, bind, 0, 0);
}
```

## Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
<code>MYSQL_NO_DATA</code>	No more rows/data exists
<code>MYSQL_DATA_TRUNCATED</code>	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is returned when truncation reporting is enabled. To determine which column values were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` structures used for fetching values. Truncation reporting is enabled by default, but can be controlled by calling `mysql_options()` with the `MYSQL_REPORT_DATA_TRUNCATION` option.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query.

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

- [CR\\_UNSUPPORTED\\_PARAM\\_TYPE](#)

The buffer type is [MYSQL\\_TYPE\\_DATE](#), [MYSQL\\_TYPE\\_TIME](#), [MYSQL\\_TYPE\\_DATETIME](#), or [MYSQL\\_TYPE\\_TIMESTAMP](#), but the data type is not [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#).

- All other unsupported conversion errors are returned from [mysql\\_stmt\\_bind\\_result\(\)](#).

## Example

The following example demonstrates how to fetch data from a table using [mysql\\_stmt\\_result\\_metadata\(\)](#), [mysql\\_stmt\\_bind\\_result\(\)](#), and [mysql\\_stmt\\_fetch\(\)](#). (This example expects to retrieve the two rows inserted by the example shown in [Section 27.8.11.10](#), “[mysql\\_stmt\\_execute\(\)](#)”.) The [mysql](#) variable is assumed to be a valid connection handler.

```
#define STRING_SIZE 50

}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    /* mysql_stmt_close() invalidates stmt, so call
     * mysql_error(mysql) rather than mysql_stmt_error(stmt) */
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_error(mysql));
    exit(0);
}

```

### 27.8.11.12 mysql\_stmt\_fetch\_column()

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int
column, unsigned long offset)
```

## Description

Fetches one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_INVALID_PARAMETER_NO`

Invalid column number.

- `CR_NO_DATA`

The end of the result set has already been reached.

### 27.8.11.13 `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

## Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

## Return Values

An unsigned integer representing the number of columns in a result set.

## Errors

None.

### 27.8.11.14 `mysql_stmt_free_result()`

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

## Description

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

## Return Values

Zero for success. Nonzero if an error occurred.

### 27.8.11.15 `mysql_stmt_init()`

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

## Description

Creates and returns a `MYSQL_STMT` handler. The handler should be freed with `mysql_stmt_close()`, at which point the handler becomes invalid and should no longer be used.

See also [Section 27.8.9, “C API Prepared Statement Data Structures”](#), for more information.

## Return Values

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

## Errors

- `CR_OUT_OF_MEMORY`

Out of memory.

### 27.8.11.16 `mysql_stmt_insert_id()`

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

## Description

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed a prepared `INSERT` statement on a table which contains an `AUTO_INCREMENT` field.

See [Section 27.8.7.38, “`mysql\_insert\_id\(\)`”](#), for more information.

## Return Values

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

## Errors

None.

### 27.8.11.17 `mysql_stmt_next_result()`

```
int mysql_stmt_next_result(MYSQL_STMT *mysql)
```

## Description

This function is used when you use prepared `CALL` statements to execute stored procedures, which can return multiple result sets. Use a loop that calls `mysql_stmt_next_result()` to determine whether there are more results. If a procedure has `OUT` or `INOUT` parameters, their values will be returned as a single-row result set following any other result sets. The values will appear in the order in which they are declared in the procedure parameter list.

`mysql_stmt_next_result()` returns a status to indicate whether more results exist. If `mysql_stmt_next_result()` returns an error, there are no more results.

Before each call to `mysql_stmt_next_result()`, you must call `mysql_stmt_free_result()` for the current result if it produced a result set (rather than just a result status).

After calling `mysql_stmt_next_result()` the state of the connection is as if you had called `mysql_stmt_execute()`. This means that you can call `mysql_stmt_bind_result()`, `mysql_stmt_affected_rows()`, and so forth.

It is also possible to test whether there are more results by calling `mysql_more_results()`. However, this function does not change the connection state, so if it returns true, you must still call `mysql_stmt_next_result()` to advance to the next result.

For an example that shows how to use `mysql_stmt_next_result()`, see [Section 27.8.18, “C API Prepared CALL Statement Support”](#).

## Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 27.8.11.18 `mysql_stmt_num_rows()`

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

## Description

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handler. If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately. Otherwise, the row count is unavailable unless you count the rows as you fetch them.

`mysql_stmt_num_rows()` is intended for use with statements that return a result set, such as `SELECT`. For statements such as `INSERT`, `UPDATE`, or `DELETE`, the number of affected rows can be obtained with `mysql_stmt_affected_rows()`.

## Return Values

The number of rows in the result set.

## Errors

None.

### 27.8.11.19 `mysql_stmt_param_count()`

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

#### Description

Returns the number of parameter markers present in the prepared statement.

#### Return Values

An unsigned long integer representing the number of parameters in a statement.

#### Errors

None.

#### Example

See the Example in [Section 27.8.11.10, “`mysql\_stmt\_execute\(\)`”](#).

### 27.8.11.20 `mysql_stmt_param_metadata()`

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

### 27.8.11.21 `mysql_stmt_prepare()`

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *stmt_str, unsigned long length)
```

#### Description

Given the statement handler returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `stmt_str` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (;) or \g to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (?) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are permitted in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not permitted for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

Metadata changes to tables or views referred to by prepared statements are detected and cause automatic reparation of the statement when it is next executed. For more information, see [Section 8.10.4, “Caching of Prepared Statements and Stored Programs”](#).

#### Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_OUT\\_OF\\_MEMORY](#)

Out of memory.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns nonzero), the error message can be obtained by calling `mysql_stmt_error()`.

## Example

See the Example in [Section 27.8.11.10, “mysql\\_stmt\\_execute\(\)”](#).

### 27.8.11.22 `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

## Description

Resets a prepared statement on client and server to state after prepare. It resets the statement on the server, data sent using `mysql_stmt_send_long_data()`, unbuffered result sets and current errors. It does not clear bindings or stored result sets. Stored result sets will be cleared when executing the prepared statement (or closing it).

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)

Commands were executed in an improper order.

- [CR\\_SERVER\\_GONE\\_ERROR](#)

The MySQL server has gone away.

- [CR\\_SERVER\\_LOST](#)

The connection to the server was lost during the query

- [CR\\_UNKNOWN\\_ERROR](#)

An unknown error occurred.

### 27.8.11.23 `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

#### Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handler with `mysql_stmt_fetch()`.

#### Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

#### Errors

- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

#### Example

See the Example in [Section 27.8.11.11, “mysql\\_stmt\\_fetch\(\)”](#).

### 27.8.11.24 `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt, MYSQL_ROW_OFFSET offset)
```

## Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

## Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

## Errors

None.

### 27.8.11.25 `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

## Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

## Return Values

The current offset of the row cursor.

## Errors

None.

### 27.8.11.26 `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int  
parameter_number, const char *data, unsigned long length)
```

## Description

Enables an application to send parameter data to the server in pieces (or “chunks”). Call this function after `mysql_stmt_bind_param()` and before `mysql_stmt_execute()`. It can be called multiple times to send the parts of a character or binary data value for a column, which must be one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

#### Note

The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 27.8.11.22, “mysql\\_stmt\\_reset\(\)”](#).

The `max_allowed_packet` system variable controls the maximum size of parameter values that can be sent with `mysql_stmt_send_long_data()`.

## Return Values

Zero for success. Nonzero if an error occurred.

## Errors

- `CR_INVALID_BUFFER_USE`

The parameter does not have a string or binary type.

- `CR_INVALID_PARAMETER_NO`

Invalid parameter number.

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value `'MySQL - The most popular Open Source database'` into the `text_column` column. The `mysql` variable is assumed to be a valid connection handler.

```
#define INSERT_QUERY "INSERT INTO \  
                    test_long_data(text_column) VALUES(?)"  
  
MYSQL_BIND bind[1];  
long          length;  
  
stmt = mysql_stmt_init(mysql);  
if (!stmt)  
{  
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");  
    exit(0);  
}  
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))  
{  
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");  
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));  
    exit(0);  
}  
memset(bind, 0, sizeof(bind));  
bind[0].buffer_type= MYSQL_TYPE_STRING;  
bind[0].length= &length;  
bind[0].is_null= 0;
```

```
/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (mysql_stmt_send_long_data(stmt, 0, "MySQL", 5))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (mysql_stmt_send_long_data(stmt, 0,
    " - The most popular Open Source database", 40))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "\n mysql_stmt_execute failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
```

### 27.8.11.27 `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Errors, Error Codes, and Common Problems](#).

Not all MySQL errors are mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

If the failed statement API function was `mysql_stmt_close()`, do not call `mysql_stmt_sqlstate()` to obtain error information because `mysql_stmt_close()` makes the statement handler invalid. Call `mysql_sqlstate()` instead.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.

### 27.8.11.28 `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

#### Description

Result sets are produced by calling `mysql_stmt_execute()` to executed prepared statements for SQL statements such as `SELECT`, `SHOW`, `DESCRIBE`, and `EXPLAIN`. By default,

result sets for successfully executed prepared statements are not buffered on the client and `mysql_stmt_fetch()` fetches them one at a time from the server. To cause the complete result set to be buffered on the client, call `mysql_stmt_store_result()` after binding data buffers with `mysql_stmt_bind_result()` and before calling `mysql_stmt_fetch()` to fetch rows. (For an example, see [Section 27.8.11.11](#), “`mysql_stmt_fetch()`”.)

`mysql_stmt_store_result()` is optional for result set processing, unless you will call `mysql_stmt_data_seek()`, `mysql_stmt_row_seek()`, or `mysql_stmt_row_tell()`. Those functions require a seekable result set.

It is unnecessary to call `mysql_stmt_store_result()` after executing an SQL statement that does not produce a result set, but if you do, it does not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 27.8.11.23](#), “`mysql_stmt_result_metadata()`”.

**Note**

MySQL does not by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications do not need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 27.8.11.3](#), “`mysql_stmt_attr_set()`”.

**Return Values**

Zero for success. Nonzero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## 27.8.12 C API Threaded Function Descriptions

To create a threaded client, use the functions described in the following sections. See also [Section 27.8.4.3](#), “Writing C API Threaded Client Programs”.

### 27.8.12.1 `my_init()`

```
void my_init(void)
```

## Description

`my_init()` initializes some global variables that MySQL needs. It also calls `mysql_thread_init()` for this thread.

It is necessary for `my_init()` to be called early in the initialization phase of a program's use of the MySQL client library. However, `my_init()` is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you ensure that your program invokes one of those functions before any other MySQL calls, there is no need to invoke `my_init()` explicitly.

To access the prototype for `my_init()`, your program should include these header files:

```
#include <my_global.h>
#include <my_sys.h>
```

## Return Values

None.

### 27.8.12.2 `mysql_thread_end()`

```
void mysql_thread_end(void)
```

## Description

Call this function before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

*`mysql_thread_end()` is not invoked automatically by the client library.*

- For release/production builds without debugging support enabled, `mysql_thread_end()` need not be called.
- For debug builds, `mysql_thread_init()` allocates debugging information for the DBUG package (see [Section 28.5.3, “The DBUG Package”](#)). `mysql_thread_end()` must be called for each `mysql_thread_init()` call to avoid a memory leak.

## Return Values

None.

### 27.8.12.3 `mysql_thread_init()`

```
my_bool mysql_thread_init(void)
```

## Description

This function must be called early within each created thread to initialize thread-specific variables. However, you may not necessarily need to invoke it explicitly: `mysql_thread_init()` is automatically called by `my_init()`, which itself is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`. If you invoke any of those functions, `mysql_thread_init()` is called for you.

## Return Values

Zero for success. Nonzero if an error occurred.

### 27.8.12.4 `mysql_thread_safe()`

```
unsigned int mysql_thread_safe(void)
```

## Description

This function indicates whether the client library is compiled as thread-safe.

## Return Values

1 if the client library is thread-safe, 0 otherwise.

## 27.8.13 C API Embedded Server Function Descriptions

MySQL applications can be written to use an embedded server. See [Section 27.7, “libmysqld, the Embedded MySQL Server Library”](#). To write such an application, you must link it against the `libmysqld` library by using the `-lmysqld` flag rather than linking it against the `libmysqlclient` client library by using the `-libmysqlclient` flag. However, the calls to initialize and finalize the library are the same whether you write a client application or one that uses the embedded server: Call `mysql_library_init()` to initialize the library and `mysql_library_end()` when you are done with it. See [Section 27.8.6, “C API Function Overview”](#).

### 27.8.13.1 mysql\_server\_end()

```
void mysql_server_end(void)
```

## Description

This function finalizes the MySQL library, which should be done when you are done using the library. However, `mysql_server_end()` is deprecated and `mysql_library_end()` should be used instead. See [Section 27.8.7.40, “mysql\\_library\\_end\(\)”](#).

#### Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_server_end()` (or `mysql_library_end()`) explicitly. This enables memory management to be performed to clean up and free resources used by the library.

## Return Values

None.

### 27.8.13.2 mysql\_server\_init()

```
int mysql_server_init(int argc, char **argv, char **groups)
```

## Description

This function initializes the MySQL client library, which must be done before you call any other MySQL function. However, `mysql_server_init()` is deprecated and you should call `mysql_library_init()` instead. See [Section 27.8.7.41, “mysql\\_library\\_init\(\)”](#).

#### Note

To avoid memory leaks after the application is done using the library (for example, after closing the connection to the server), be sure to call `mysql_server_end()` (or `mysql_library_end()`) explicitly. This enables memory management to be performed to clean up and free resources used by the library. See [Section 27.8.7.40, “mysql\\_library\\_end\(\)”](#).

## Return Values

Zero for success. Nonzero if an error occurred.

## 27.8.14 C API Client Plugin Functions

This section describes functions used for the client-side plugin API. They enable management of client plugins. For a description of the `st_mysql_client_plugin` structure used by these functions, see [Client Plugin Descriptors](#).

It is unlikely that a client program needs to call the functions in this section. For example, a client that supports the use of authentication plugins normally causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

### 27.8.14.1 `mysql_client_find_plugin()`

```
struct st_mysql_client_plugin *mysql_client_find_plugin(MYSQL *mysql, const
char *name, int type)
```

## Description

Returns a pointer to a loaded plugin, loading the plugin first if necessary. An error occurs if the type is invalid or the plugin cannot be found or loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The plugin name.
- `type`: The plugin type.

## Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

## Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 27.8.7.15](#), “`mysql_error()`”, and [Section 27.8.7.14](#), “`mysql_errno()`”.

## Example

```
MYSQL mysql;
struct st_mysql_client_plugin *p;
```

```
if ((p = mysql_client_find_plugin(&mysql, "myplugin",
                                MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0)))
{
    printf("Plugin version: %d.%d.%d\n", p->version[0], p->version[1], p->version[2]);
}
```

### 27.8.14.2 `mysql_client_register_plugin()`

```
struct st_mysql_client_plugin *mysql_client_register_plugin(MYSQL *mysql,
struct st_mysql_client_plugin *plugin)
```

#### Description

Adds a plugin structure to the list of loaded plugins. An error occurs if the plugin is already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `plugin`: A pointer to the plugin structure.

#### Return Values

A pointer to the plugin for success. `NULL` if an error occurred.

#### Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 27.8.7.15](#), “`mysql_error()`”, and [Section 27.8.7.14](#), “`mysql_errno()`”.

### 27.8.14.3 `mysql_load_plugin()`

```
struct st_mysql_client_plugin *mysql_load_plugin(MYSQL *mysql, const char
*name, int type, int argc, ...)
```

#### Description

Loads a MySQL client plugin, specified by name and type. An error occurs if the type is invalid or the plugin cannot be loaded.

It is not possible to load multiple plugins of the same type. An error occurs if you try to load a plugin of a type already loaded.

Specify the parameters as follows:

- `mysql`: A pointer to a `MYSQL` structure. The plugin API does not require a connection to a MySQL server, but this structure must be properly initialized. The structure is used to obtain connection-related information.
- `name`: The name of the plugin to load.
- `type`: The type of plugin to load, or `-1` to disable type checking. If type is not `-1`, only plugins matching the type are considered for loading.
- `argc`: The number of following arguments (0 if there are none). Interpretation of any following arguments depends on the plugin type.

Another way to cause plugins to be loaded is to set the `LIBMYSQL_PLUGINS` environment variable to a semicolon-separated list of plugin names. For example:

```
shell> export LIBMYSQL_PLUGINS="myplugin1;myplugin2"
```

Plugins named by `LIBMYSQL_PLUGINS` are loaded when the client program calls `mysql_library_init()`. No error is reported if problems occur loading these plugins.

The `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the path name of the directory in which to look for client plugins. This variable is used in two ways:

- During client plugin preloading, the value of the `--plugin-dir` option is not available, so client plugin loading fails unless the plugins are located in the hardwired default directory. If the plugins are located elsewhere, `LIBMYSQL_PLUGIN_DIR` environment variable can be set to the proper directory to enable plugin preloading to succeed.
- For explicit client plugin loading, the `mysql_load_plugin()` and `mysql_load_plugin_v()` C API functions use the `LIBMYSQL_PLUGIN_DIR` value if it exists and the `--plugin-dir` option was not given. If `--plugin-dir` is given, `mysql_load_plugin()` and `mysql_load_plugin_v()` ignore `LIBMYSQL_PLUGIN_DIR`.

## Return Values

A pointer to the plugin if it was loaded successfully. `NULL` if an error occurred.

## Errors

To check for errors, call the `mysql_error()` or `mysql_errno()` function. See [Section 27.8.7.15, “mysql\\_error\(\)”](#), and [Section 27.8.7.14, “mysql\\_errno\(\)”](#).

## Example

```
MYSQL mysql;

if(!mysql_load_plugin(&mysql, "myplugin",
                     MYSQL_CLIENT_AUTHENTICATION_PLUGIN, 0))
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
    exit(-1);
}
```

## See Also

See also [Section 27.8.14.3, “mysql\\_load\\_plugin\(\)”](#), [Section 27.8.7.15, “mysql\\_error\(\)”](#), [Section 27.8.7.14, “mysql\\_errno\(\)”](#).

### 27.8.14.4 mysql\_load\_plugin\_v()

```
struct st_mysql_client_plugin *mysql_load_plugin_v(MYSQL *mysql, const char
*name, int type, int argc, va_list args)
```

## Description

This function is equivalent to `mysql_load_plugin()`, but it accepts a `va_list` instead of a variable list of parameters.

## See Also

See also [Section 27.8.14.3, “mysql\\_load\\_plugin\(\)”](#).

### 27.8.14.5 `mysql_plugin_options()`

```
int mysql_plugin_options(struct st_mysql_client_plugin *plugin, const char
*option, const void *value)
```

#### Description

Passes an option type and value to a plugin. This function can be called multiple times to set several options. If the plugin does not have an option handler, an error occurs.

Specify the parameters as follows:

- `plugin`: A pointer to the plugin structure.
- `option`: The option to be set.
- `value`: A pointer to the option value.

#### Return Values

Zero for success, 1 if an error occurred. If the plugin has an option handler, that handler should also return zero for success and 1 if an error occurred.

## 27.8.15 C API Encrypted Connection Support

This section describes how C applications use the C API capabilities for encrypted connections. By default, MySQL programs attempt to connect using encryption if the server supports encrypted connections, falling back to an unencrypted connection if an encrypted connection cannot be established (see [Section 6.4.1, “Configuring MySQL to Use Encrypted Connections”](#)). For applications that require control beyond the default behavior over how encrypted connections are established, the C API provides these capabilities:

- The `mysql_options()` function enables applications to set the appropriate SSL/TLS options before calling `mysql_real_connect()`. For example, to require the use of an encrypted connection, see [Enforcing an Encrypted Connection](#).
- The `mysql_get_ssl_cipher()` function enables applications to determine, after a connection has been established, whether the connection uses encryption. A `NULL` return value indicates that encryption is not being used. A non-`NULL` return value indicates an encrypted connection and names the encryption cipher. See [Section 27.8.7.34, “mysql\\_get\\_ssl\\_cipher\(\)”](#).
- [C API Options for Encrypted Connections](#)
- [Enforcing an Encrypted Connection](#)
- [Improving Security of Encrypted Connections](#)

### C API Options for Encrypted Connections

`mysql_options()` provides the following options for control over use of encrypted connections. For option details, see [Section 27.8.7.50, “mysql\\_options\(\)”](#).

- `MYSQL_OPT_SSL_CA`: The path name of the Certificate Authority (CA) certificate file. This option, if used, must specify the same certificate used by the server.
- `MYSQL_OPT_SSL_CAPATH`: The path name of the directory that contains trusted SSL CA certificate files.
- `MYSQL_OPT_SSL_CERT`: The path name of the client public key certificate file.
- `MYSQL_OPT_SSL_CIPHER`: The list of permitted ciphers for SSL encryption.

- `MYSQL_OPT_SSL_CRL`: The path name of the file containing certificate revocation lists.
- `MYSQL_OPT_SSL_CRLPATH`: The path name of the directory that contains certificate revocation list files.
- `MYSQL_OPT_SSL_KEY`: The path name of the client private key file.
- `MYSQL_OPT_SSL_MODE`: The connection security state.
- `MYSQL_OPT_SSL_VERIFY_SERVER_CERT`: Whether to perform host name identity verification of the server certificate Common Name value.
- `MYSQL_OPT_TLS_VERSION`: The encryption protocols permitted by the client.

`mysql_ssl_set()` can be used as a convenience routine that is equivalent to a set of `mysql_options()` calls that specify certificate and key files, encryption ciphers, and so forth. See [Section 27.8.7.73, “mysql\\_ssl\\_set\(\)”](#).

## Enforcing an Encrypted Connection

`mysql_options()` options for information such as SSL certificate and key files are used to establish an encrypted connection if such connections are available, but do not enforce any requirement that the connection obtained be encrypted. To require an encrypted connection, use the following technique:

1. Call `mysql_options()` as necessary supply the appropriate SSL parameters (certificate and key files, encryption ciphers, and so forth).
2. Call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_REQUIRED` or one of the more-restrictive option values.
3. Call `mysql_real_connect()` to connect to the server. The call fails if an encrypted connection cannot be obtained; exit with an error.

## Improving Security of Encrypted Connections

For additional security relative to that provided by the default encryption, clients can supply a CA certificate matching the one used by the server and enable host name identity verification. In this way, the server and client place their trust in the same CA certificate and the client verifies that the host to which it connected is the one intended:

- To specify the CA certificate, call `mysql_options()` to pass the `MYSQL_OPT_SSL_CA` (or `MYSQL_OPT_SSL_CAPATH`) option, and call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_CA`.
- To enable host name identity verification as well, call `mysql_options()` to pass the `MYSQL_OPT_SSL_MODE` option with a value of `SSL_MODE_VERIFY_IDENTITY` rather than `SSL_MODE_VERIFY_CA`.

### Note

Host name identity verification does not work with self-signed certificates created automatically by the server, or manually using `mysql_ssl_rsa_setup` (see [Section 6.4.3.1, “Creating SSL and RSA Certificates and Keys using MySQL”](#)). Such self-signed certificates do not contain the server name as the Common Name value.

## 27.8.16 C API Multiple Statement Execution Support

By default, `mysql_query()` and `mysql_real_query()` interpret their statement string argument as a single statement to be executed, and you process the result according to whether the statement

produces a result set (a set of rows, as for `SELECT`) or an affected-rows count (as for `INSERT`, `UPDATE`, and so forth).

MySQL also supports the execution of a string containing multiple statements separated by semicolon (;) characters. This capability is enabled by special options that are specified either when you connect to the server with `mysql_real_connect()` or after connecting by calling `mysql_set_server_option()`.

Executing a multiple-statement string can produce multiple result sets or row-count indicators. Processing these results involves a different approach than for the single-statement case: After handling the result from the first statement, it is necessary to check whether more results exist and process them in turn if so. To support multiple-result processing, the C API includes the `mysql_more_results()` and `mysql_next_result()` functions. These functions are used at the end of a loop that iterates as long as more results are available. *Failure to process the result this way may result in a dropped connection to the server.*

Multiple-result processing also is required if you execute `CALL` statements for stored procedures. Results from a stored procedure have these characteristics:

- Statements within the procedure may produce result sets (for example, if it executes `SELECT` statements). These result sets are returned in the order that they are produced as the procedure executes.

In general, the caller cannot know how many result sets a procedure will return. Procedure execution may depend on loops or conditional statements that cause the execution path to differ from one call to the next. Therefore, you must be prepared to retrieve multiple results.

- The final result from the procedure is a status result that includes no result set. The status indicates whether the procedure succeeded or an error occurred.

The multiple statement and result capabilities can be used only with `mysql_query()` or `mysql_real_query()`. They cannot be used with the prepared statement interface. Prepared statement handlers are defined to work only with strings that contain a single statement. See [Section 27.8.8, “C API Prepared Statements”](#).

To enable multiple-statement execution and result processing, the following options may be used:

- The `mysql_real_connect()` function has a `flags` argument for which two option values are relevant:
  - `CLIENT_MULTI_RESULTS` enables the client program to process multiple results. This option *must* be enabled if you execute `CALL` statements for stored procedures that produce result sets. Otherwise, such procedures result in an error `Error 1312 (0A000): PROCEDURE proc_name can't return a result set in the given context`. In MySQL 5.7, `CLIENT_MULTI_RESULTS` is enabled by default.
  - `CLIENT_MULTI_STATEMENTS` enables `mysql_query()` and `mysql_real_query()` to execute statement strings containing multiple statements separated by semicolons. This option also enables `CLIENT_MULTI_RESULTS` implicitly, so a `flags` argument of `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()` is equivalent to an argument of `CLIENT_MULTI_STATEMENTS | CLIENT_MULTI_RESULTS`. That is, `CLIENT_MULTI_STATEMENTS` is sufficient to enable multiple-statement execution and all multiple-result processing.
- After the connection to the server has been established, you can use the `mysql_set_server_option()` function to enable or disable multiple-statement execution by passing it an argument of `MYSQL_OPTION_MULTI_STATEMENTS_ON` or `MYSQL_OPTION_MULTI_STATEMENTS_OFF`. Enabling multiple-statement execution with this function also enables processing of “simple” results for a multiple-statement string where each statement produces a single result, but is *not* sufficient to permit processing of stored procedures that produce result sets.

The following procedure outlines a suggested strategy for handling multiple statements:

1. Pass `CLIENT_MULTI_STATEMENTS` to `mysql_real_connect()`, to fully enable multiple-statement execution and multiple-result processing.
2. After calling `mysql_query()` or `mysql_real_query()` and verifying that it succeeds, enter a loop within which you process statement results.
3. For each iteration of the loop, handle the current statement result, retrieving either a result set or an affected-rows count. If an error occurs, exit the loop.
4. At the end of the loop, call `mysql_next_result()` to check whether another result exists and initiate retrieval for it if so. If no more results are available, exit the loop.

One possible implementation of the preceding strategy is shown following. The final part of the loop can be reduced to a simple test of whether `mysql_next_result()` returns nonzero. The code as written distinguishes between no more results and an error, which enables a message to be printed for the latter occurrence.

```
/* connect to server with the CLIENT_MULTI_STATEMENTS option */
if (mysql_real_connect (mysql, host_name, user_name, password,
    db_name, port_num, socket_name, CLIENT_MULTI_STATEMENTS) == NULL)
{
    printf("mysql_real_connect() failed\n");
    mysql_close(mysql);
    exit(1);
}

/* execute multiple statements */
status = mysql_query(mysql,
    "DROP TABLE IF EXISTS test_table;\n
    CREATE TABLE test_table(id INT);\n
    INSERT INTO test_table VALUES(10);\n
    UPDATE test_table SET id=20 WHERE id=10;\n
    SELECT * FROM test_table;\n
    DROP TABLE test_table");

if (status)
{
    printf("Could not execute statement(s)");
    mysql_close(mysql);
    exit(0);
}

/* process each statement result */
do {
    /* did current statement return data? */
    result = mysql_store_result(mysql);
    if (result)
    {
        /* yes; process rows and free the result set */
        process_result_set(mysql, result);
        mysql_free_result(result);
    }
    else /* no result set or error */
    {
        if (mysql_field_count(mysql) == 0)
        {
            printf("%lld rows affected\n",
                mysql_affected_rows(mysql));
        }
        else /* some error occurred */
        {
            printf("Could not retrieve result set\n");
            break;
        }
    }
}
/* more results? -1 = no, >0 = error, 0 = yes (keep looping) */
if ((status = mysql_next_result(mysql)) > 0)
```

```

    printf("Could not execute statement\n");
} while (status == 0);

mysql_close(mysql);

```

## 27.8.17 C API Prepared Statement Handling of Date and Time Values

The binary (prepared statement) protocol enables you to send and receive date and time values ([DATE](#), [TIME](#), [DATETIME](#), and [TIMESTAMP](#)), using the [MYSQL\\_TIME](#) structure. The members of this structure are described in [Section 27.8.9, "C API Prepared Statement Data Structures"](#).

To send temporal data values, create a prepared statement using [mysql\\_stmt\\_prepare\(\)](#). Then, before calling [mysql\\_stmt\\_execute\(\)](#) to execute the statement, use the following procedure to set up each temporal parameter:

1. In the [MYSQL\\_BIND](#) structure associated with the data value, set the [buffer\\_type](#) member to the type that indicates what kind of temporal value you're sending. For [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#) values, set [buffer\\_type](#) to [MYSQL\\_TYPE\\_DATE](#), [MYSQL\\_TYPE\\_TIME](#), [MYSQL\\_TYPE\\_DATETIME](#), or [MYSQL\\_TYPE\\_TIMESTAMP](#), respectively.
2. Set the [buffer](#) member of the [MYSQL\\_BIND](#) structure to the address of the [MYSQL\\_TIME](#) structure in which you pass the temporal value.
3. Fill in the members of the [MYSQL\\_TIME](#) structure that are appropriate for the type of temporal value to pass.

Use [mysql\\_stmt\\_bind\\_param\(\)](#) to bind the parameter data to the statement. Then you can call [mysql\\_stmt\\_execute\(\)](#).

To retrieve temporal values, the procedure is similar, except that you set the [buffer\\_type](#) member to the type of value you expect to receive, and the [buffer](#) member to the address of a [MYSQL\\_TIME](#) structure into which the returned value should be placed. Use [mysql\\_stmt\\_bind\\_result\(\)](#) to bind the buffers to the statement after calling [mysql\\_stmt\\_execute\(\)](#) and before fetching the results.

Here is a simple example that inserts [DATE](#), [TIME](#), and [TIMESTAMP](#) data. The [mysql](#) variable is assumed to be a valid connection handler.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field, \
                                timestamp_field) VALUES(?,?,?");

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...

```

```

bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

## 27.8.18 C API Prepared CALL Statement Support

This section describes prepared-statement support in the C API for stored procedures executed using [CALL](#) statements:

Stored procedures executed using prepared [CALL](#) statements can be used in the following ways:

- A stored procedure can produce any number of result sets. The number of columns and the data types of the columns need not be the same for all result sets.
- The final values of [OUT](#) and [INOUT](#) parameters are available to the calling application after the procedure returns. These parameters are returned as an extra single-row result set following any result sets produced by the procedure itself. The row contains the values of the [OUT](#) and [INOUT](#) parameters in the order in which they are declared in the procedure parameter list.

The following discussion shows how to use these capabilities through the C API for prepared statements. To use prepared [CALL](#) statements through the [PREPARE](#) and [EXECUTE](#) statements, see [Section 13.2.1, “CALL Syntax”](#).

An application that executes a prepared [CALL](#) statement should use a loop that fetches a result and then invokes `mysql_stmt_next_result()` to determine whether there are more results. The results consist of any result sets produced by the stored procedure followed by a final status value that indicates whether the procedure terminated successfully.

If the procedure has [OUT](#) or [INOUT](#) parameters, the result set preceding the final status value contains their values. To determine whether a result set contains parameter values, test whether the `SERVER_PS_OUT_PARAMS` bit is set in the `server_status` member of the [MYSQL](#) connection handler:

```
mysql->server_status & SERVER_PS_OUT_PARAMS
```

The following example uses a prepared [CALL](#) statement to execute a stored procedure that produces multiple result sets and that provides parameter values back to the caller by means of [OUT](#) and [INOUT](#) parameters. The procedure takes parameters of all three types ([IN](#), [OUT](#), [INOUT](#)), displays their initial values, assigns new values, displays the updated values, and returns. The expected return information from the procedure therefore consists of multiple result sets and a final status:

- One result set from a [SELECT](#) that displays the initial parameter values: `10`, `NULL`, `30`. (The [OUT](#) parameter is assigned a value by the caller, but this assignment is expected to be ineffective: [OUT](#) parameters are seen as `NULL` within a procedure until assigned a value within the procedure.)
- One result set from a [SELECT](#) that displays the modified parameter values: `100`, `200`, `300`.
- One result set containing the final [OUT](#) and [INOUT](#) parameter values: `200`, `300`.

- A final status packet.

The code to execute the procedure:

```

MYSQL_STMT *stmt;
MYSQL_BIND ps_params[3]; /* input parameter buffers */
int int_data[3]; /* input/output values */
my_bool is_null[3]; /* output value nullability */
int status;

/* set up stored procedure */
status = mysql_query(mysql, "DROP PROCEDURE IF EXISTS p1");
test_error(mysql, status);

status = mysql_query(mysql,
    "CREATE PROCEDURE p1("
    "  IN p_in INT, "
    "  OUT p_out INT, "
    "  INOUT p_inout INT) "
    "BEGIN "
    "  SELECT p_in, p_out, p_inout; "
    "  SET p_in = 100, p_out = 200, p_inout = 300; "
    "  SELECT p_in, p_out, p_inout; "
    "END");
test_error(mysql, status);

/* initialize and prepare CALL statement with parameter placeholders */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    printf("Could not initialize statement\n");
    exit(1);
}
status = mysql_stmt_prepare(stmt, "CALL p1(?, ?, ?)", 16);
test_stmt_error(stmt, status);

/* initialize parameters: p_in, p_out, p_inout (all INT) */
memset(ps_params, 0, sizeof (ps_params));

ps_params[0].buffer_type = MYSQL_TYPE_LONG;
ps_params[0].buffer = (char *) &int_data[0];
ps_params[0].length = 0;
ps_params[0].is_null = 0;

ps_params[1].buffer_type = MYSQL_TYPE_LONG;
ps_params[1].buffer = (char *) &int_data[1];
ps_params[1].length = 0;
ps_params[1].is_null = 0;

ps_params[2].buffer_type = MYSQL_TYPE_LONG;
ps_params[2].buffer = (char *) &int_data[2];
ps_params[2].length = 0;
ps_params[2].is_null = 0;

/* bind parameters */
status = mysql_stmt_bind_param(stmt, ps_params);
test_stmt_error(stmt, status);

/* assign values to parameters and execute statement */
int_data[0] = 10; /* p_in */
int_data[1] = 20; /* p_out */
int_data[2] = 30; /* p_inout */

status = mysql_stmt_execute(stmt);
test_stmt_error(stmt, status);

/* process results until there are no more */
do {
    int i;
    int num_fields; /* number of columns in result */
    MYSQL_FIELD *fields; /* for result set metadata */

```

```

MYSQL_BIND *rs_bind; /* for output buffers */

/* the column count is > 0 if there is a result set */
/* 0 if the result is only the final status packet */
num_fields = mysql_stmt_field_count(stmt);

if (num_fields > 0)
{
    /* there is a result set to fetch */
    printf("Number of columns in result: %d\n", (int) num_fields);

    /* what kind of result set is this? */
    printf("Data: ");
    if(mysql->server_status & SERVER_PS_OUT_PARAMS)
        printf("this result set contains OUT/INOUT parameters\n");
    else
        printf("this result set is produced by the procedure\n");

    MYSQL_RES *rs_metadata = mysql_stmt_result_metadata(stmt);
    test_stmt_error(stmt, rs_metadata == NULL);

    fields = mysql_fetch_fields(rs_metadata);

    rs_bind = (MYSQL_BIND *) malloc(sizeof (MYSQL_BIND) * num_fields);
    if (!rs_bind)
    {
        printf("Cannot allocate output buffers\n");
        exit(1);
    }
    memset(rs_bind, 0, sizeof (MYSQL_BIND) * num_fields);

    /* set up and bind result set output buffers */
    for (i = 0; i < num_fields; ++i)
    {
        rs_bind[i].buffer_type = fields[i].type;
        rs_bind[i].is_null = &is_null[i];

        switch (fields[i].type)
        {
            case MYSQL_TYPE_LONG:
                rs_bind[i].buffer = (char *) &(int_data[i]);
                rs_bind[i].buffer_length = sizeof (int_data);
                break;

            default:
                fprintf(stderr, "ERROR: unexpected type: %d.\n", fields[i].type);
                exit(1);
        }
    }

    status = mysql_stmt_bind_result(stmt, rs_bind);
    test_stmt_error(stmt, status);

    /* fetch and display result set rows */
    while (1)
    {
        status = mysql_stmt_fetch(stmt);

        if (status == 1 || status == MYSQL_NO_DATA)
            break;

        for (i = 0; i < num_fields; ++i)
        {
            switch (rs_bind[i].buffer_type)
            {
                case MYSQL_TYPE_LONG:
                    if (*rs_bind[i].is_null)
                        printf(" val[%d] = NULL;", i);
                    else
                        printf(" val[%d] = %ld;",
                            i, (long) *((int *) rs_bind[i].buffer));
                    break;
            }
        }
    }
}

```

```

        default:
            printf(" unexpected type (%d)\n",
                rs_bind[i].buffer_type);
        }
    }
    printf("\n");
}

mysql_free_result(rs_metadata); /* free metadata */
free(rs_bind);                 /* free output buffers */
}
else
{
    /* no columns = final status packet */
    printf("End of procedure output\n");
}

/* more results? -1 = no, >0 = error, 0 = yes (keep looking) */
status = mysql_stmt_next_result(stmt);
if (status > 0)
    test_stmt_error(stmt, status);
} while (status == 0);

mysql_stmt_close(stmt);

```

Execution of the procedure should produce the following output:

```

Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 10; val[1] = NULL; val[2] = 30;
Number of columns in result: 3
Data: this result set is produced by the procedure
  val[0] = 100; val[1] = 200; val[2] = 300;
Number of columns in result: 2
Data: this result set contains OUT/INOUT parameters
  val[0] = 200; val[1] = 300;
End of procedure output

```

The code uses two utility routines, `test_error()` and `test_stmt_error()`, to check for errors and terminate after printing diagnostic information if an error occurred:

```

static void test_error(MYSQL *mysql, int status)
{
    if (status)
    {
        fprintf(stderr, "Error: %s (errno: %d)\n",
            mysql_error(mysql), mysql_errno(mysql));
        exit(1);
    }
}

static void test_stmt_error(MYSQL_STMT *stmt, int status)
{
    if (status)
    {
        fprintf(stderr, "Error: %s (errno: %d)\n",
            mysql_stmt_error(stmt), mysql_stmt_errno(stmt));
        exit(1);
    }
}

```

## 27.8.19 C API Prepared Statement Problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example, from `DATE_FORMAT()`).

- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server does not print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating-point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- Prepared statements use the query cache under the conditions described in [Section 8.10.3.1, “How the Query Cache Operates”](#).
- Prepared statements do not support multi-statements (that is, multiple statements within a single string separated by `;` characters).
- The capabilities of prepared `CALL` statements are described in [Section 27.8.18, “C API Prepared CALL Statement Support”](#).

## 27.8.20 C API Automatic Reconnection Control

The MySQL client library can perform an automatic reconnection to the server if it finds that the connection is down when you attempt to send a statement to the server to be executed. If auto-reconnect is enabled, the library tries once to reconnect to the server and send the statement again.

Auto-reconnect is disabled by default.

If it is important for your application to know that the connection has been dropped (so that it can exit or take action to adjust for the loss of state information), be sure that auto-reconnect is disabled. To ensure this, call `mysql_options()` with the `MYSQL_OPT_RECONNECT` option:

```
my_bool reconnect = 0;
mysql_options(&mysql, MYSQL_OPT_RECONNECT, &reconnect);
```

If the connection has gone down, the effect of `mysql_ping()` depends on the auto-reconnect state. If auto-reconnect is enabled, `mysql_ping()` performs a reconnect. Otherwise, it returns an error.

Some client programs might provide the capability of controlling automatic reconnection. For example, `mysql` reconnects by default, but the `--skip-reconnect` option can be used to suppress this behavior.

If an automatic reconnection does occur (for example, as a result of calling `mysql_ping()`), there is no explicit indication of it. To check for reconnection, call `mysql_thread_id()` to get the original connection identifier before calling `mysql_ping()`, then call `mysql_thread_id()` again to see whether the identifier changed.

Automatic reconnection can be convenient because you need not implement your own reconnect code, but if a reconnection does occur, several aspects of the connection state are reset on the server side and your application will not be notified.

The connection-related state is affected as follows:

- Any active transactions are rolled back and autocommit mode is reset.
- All table locks are released.
- All `TEMPORARY` tables are closed (and dropped).
- Session system variables are reinitialized to the values of the corresponding global system variables, including system variables that are set implicitly by statements such as `SET NAMES`.
- User variable settings are lost.
- Prepared statements are released.

- `HANDLER` variables are closed.
- The value of `LAST_INSERT_ID()` is reset to 0.
- Locks acquired with `GET_LOCK()` are released.
- The association of the client with the Performance Schema `threads` table row that determines connection thread instrumentation is lost. If the client reconnects after a disconnect, the session is associated with a new row in the `threads` table and the thread monitoring state may be different. See [Section 25.11.16.3, “The threads Table”](#).

If reconnection occurs, any SQL statement specified by calling `mysql_options()` with the `MYSQL_INIT_COMMAND` option is re-executed.

If the connection drops, it is possible that the session associated with the connection on the server side will still be running if the server has not yet detected that the client is no longer connected. In this case, any locks held by the original connection still belong to that session, so you may want to kill it by calling `mysql_kill()`.

## 27.8.21 C API Common Issues

### 27.8.21.1 Why `mysql_store_result()` Sometimes Returns NULL After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data could not be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a nonempty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a nonzero value, the statement should have produced a nonempty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

### 27.8.21.2 What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an `INSERT`, `UPDATE`, or `DELETE`.

For a fast re-create, use `TRUNCATE TABLE`.

- `mysql_num_rows()` returns the number of rows in a result set. With `mysql_store_result()`, `mysql_num_rows()` may be called as soon as `mysql_store_result()` returns. With `mysql_use_result()`, `mysql_num_rows()` may be called only after you have fetched all the rows with `mysql_fetch_row()`.
- `mysql_insert_id()` returns the ID generated by the last query that inserted a row into a table with an `AUTO_INCREMENT` index. See [Section 27.8.7.38, “mysql\\_insert\\_id\(\)”](#).
- Some queries (`LOAD DATA INFILE ...`, `INSERT INTO ... SELECT ...`, `UPDATE`) return additional information. The result is returned by `mysql_info()`. See the description for `mysql_info()` for the format of the string that it returns. `mysql_info()` returns a `NULL` pointer if there is no additional information.

### 27.8.21.3 How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an `AUTO_INCREMENT` column, you can obtain the value stored into that column by calling the `mysql_insert_id()` function.

You can check from your C applications whether a value was stored in an `AUTO_INCREMENT` column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an `INSERT` with an `AUTO_INCREMENT` index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

When a new `AUTO_INCREMENT` value has been generated, you can also obtain it by executing a `SELECT LAST_INSERT_ID()` statement with `mysql_query()` and retrieving the value from the result set returned by the statement.

When inserting multiple values, the last automatically incremented value is returned.

For `LAST_INSERT_ID()`, the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another `AUTO_INCREMENT` column with a nonmagic value (that is, a value that is not `NULL` and not `0`). Using `LAST_INSERT_ID()` and `AUTO_INCREMENT` columns simultaneously from multiple clients is perfectly valid. Each client will receive the last inserted ID for the last statement *that* client executed.

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text');           # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

`mysql_insert_id()` returns the value stored into an `AUTO_INCREMENT` column, whether that value is automatically generated by storing `NULL` or `0` or was specified as an explicit value. `LAST_INSERT_ID()` returns only automatically generated `AUTO_INCREMENT` values. If you store an explicit value other than `NULL` or `0`, it does not affect the value returned by `LAST_INSERT_ID()`.

For more information on obtaining the last ID in an `AUTO_INCREMENT` column:

- For information on `LAST_INSERT_ID()`, which can be used within an SQL statement, see [Section 12.14, “Information Functions”](#).
- For information on `mysql_insert_id()`, the function you use from within the C API, see [Section 27.8.7.38, “mysql\\_insert\\_id\(\)”](#).
- For information on obtaining the auto-incremented value when using Connector/J, see [Retrieving AUTO\\_INCREMENT Column Values through JDBC](#).
- For information on obtaining the auto-incremented value when using Connector/ODBC, see [Obtaining Auto-Increment Values](#).

## 27.9 MySQL PHP API

The MySQL PHP API manual is now published in standalone form, not as part of the MySQL Reference Manual. See [MySQL and PHP](#).

## 27.10 MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI with MySQL, install the following:

1. The `DBI` module.
2. The `DBD::mysql` module. This is the DataBase Driver (DBD) module for Perl.
3. Optionally, the DBD module for any other type of database server you want to access.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

These sections contain information about using Perl with MySQL and writing MySQL applications in Perl:

- For installation instructions for Perl DBI support, see [Section 2.12, “Perl Installation Notes”](#).
- For an example of reading options from option files, see [Section 5.6.4, “Using Client Programs in a Multiple-Server Environment”](#).
- For secure coding tips, see [Section 6.1.1, “Security Guidelines”](#).
- For debugging tips, see [Section 28.5.1.4, “Debugging mysqld under gdb”](#).
- For some Perl-specific environment variables, see [Section 4.9, “MySQL Program Environment Variables”](#).
- For considerations for running on OS X, see [Section 2.4, “Installing MySQL on macOS”](#).
- For ways to quote string literals, see [Section 9.1.1, “String Literals”](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI:FAQ
shell> perldoc DBD:mysql
```

You can also use `pod2man`, `pod2html`, and so on to translate this information into other formats.

- For online information about Perl DBI, visit the DBI website, <http://dbi.perl.org/>. That site hosts a general DBI mailing list. Oracle Corporation hosts a list specifically about `DBD::mysql`; see [Section 1.6.2, “MySQL Mailing Lists”](#).
- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI website, <http://dbi.perl.org/>.

## 27.11 MySQL Python API

`MySQLdb` is a third-party driver that provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

The new MySQL Connector/Python component provides an interface to the same Python API, and is built into the MySQL Server and supported by Oracle. See [MySQL Connector/Python Developer Guide](#) for details on the Connector, as well as coding guidelines for Python applications and sample Python code.

## 27.12 MySQL Ruby APIs

Two APIs are available for Ruby programmers developing MySQL applications:

- The MySQL/Ruby API is based on the [libmysqlclient](#) API library. For information on installing and using the MySQL/Ruby API, see [Section 27.12.1, “The MySQL/Ruby API”](#).
- The Ruby/MySQL API is written to use the native MySQL network protocol (a native driver). For information on installing and using the Ruby/MySQL API, see [Section 27.12.2, “The Ruby/MySQL API”](#).

For background and syntax information about the Ruby language, see [Ruby Programming Language](#).

### 27.12.1 The MySQL/Ruby API

The MySQL/Ruby module provides access to MySQL databases using Ruby through [libmysqlclient](#).

For information on installing the module, and the functions exposed, see [MySQL/Ruby](#).

### 27.12.2 The Ruby/MySQL API

The Ruby/MySQL module provides access to MySQL databases using Ruby through a native driver interface using the MySQL network protocol.

For information on installing the module, and the functions exposed, see [Ruby/MySQL](#).

## 27.13 MySQL Tcl API

[MySQLtcl](#) is a simple API for accessing a MySQL database server from the [Tcl programming language](#). It can be found at <http://www.xdobry.de/mysqltcl/>.

## 27.14 MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the [Eiffel programming language](#), written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

### 28.1 MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. To track or contribute to MySQL development, follow the instructions in [Section 2.9.3, “Installing MySQL Using a Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our [internals](#) mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.6.2, “MySQL Mailing Lists”](#). Many MySQL developers at Oracle Corporation are on the [internals](#) list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

#### 28.1.1 MySQL Threads

The MySQL server creates the following threads:

- Connection manager threads handle client connection requests on the network interfaces that the server listens to. On all platforms, one manager thread handles TCP/IP connection requests. On Unix, this manager thread also handles Unix socket file connection requests. On Windows, a manager thread handles shared-memory connection requests, and another handles named-pipe connection requests. The server does not create threads to handle interfaces that it does not listen to. For example, a Windows server that does not have support for named-pipe connections enabled does not create a thread to handle them.
- Connection manager threads associate each client connection with a thread dedicated to it that handles authentication and request processing for that connection. Manager threads create a new thread when necessary but try to avoid doing so by consulting the thread cache first to see whether it contains a thread that can be used for the connection. When a connection ends, its thread is returned to the thread cache if the cache is not full.

For information about tuning the parameters that control thread resources, see [Section 8.12.5.1, “How MySQL Uses Threads for Client Connections”](#).

- On a master replication server, connections from slave servers are handled like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- A signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `InnoDB` is used, there will be additional read and write threads by default. The number of these are controlled by the `innodb_read_io_threads` and `innodb_write_io_threads` parameters. See [Section 14.14, “InnoDB Startup Options and System Variables”](#).
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- If the event scheduler is active, there is one thread for the scheduler, and a thread for each event currently running. See [Section 23.4.1, “Event Scheduler Overview”](#).

`mysqladmin processlist` only shows the connection, replication, and event threads.

## 28.1.2 The MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

You can also write your own test cases. For information about the MySQL Test Framework, including system requirements, see the manual available at <https://dev.mysql.com/doc/mysqltest/2.0/en/>.

The current set of test cases does not test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a Perl script to run all tests (`mysql-test-run.pl`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run.pl`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run.pl`. All tests should succeed. If any do not, feel free to try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.7, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run.pl` with the `--force` option to check whether any other tests fail.

If you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should set the `MTR_BUILD_THREAD` environment variable to an appropriate value, and the test suite will use a different set of ports for master, slave, and NDB). For example:

```
shell> export MTR_BUILD_THREAD=31
shell> ./mysql-test-run.pl [options] [test_name]
```

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run.pl test_name`.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL `internals` mailing list. See [Section 1.6.2, “MySQL Mailing Lists”](#).

## 28.2 The MySQL Plugin API

MySQL supports a plugin API that enables creation of server components. Plugins can be loaded at server startup, or loaded and unloaded at runtime without restarting the server. The API is generic and does not specify what plugins can do. The components supported by this interface include, but are not limited to, storage engines, full-text parser plugins, and server extensions.

For example, full-text parser plugins can be used to replace or augment the built-in full-text parser. A plugin can parse text into words using rules that differ from those used by the built-in parser. This can be useful if you need to parse text with characteristics different from those expected by the built-in parser.

The plugin interface is more general than the older user-defined function (UDF) interface.

The plugin interface uses the `plugin` table in the `mysql` database to record information about plugins that have been installed permanently with the `INSTALL PLUGIN` statement. This table is created as part of the MySQL installation process. Plugins can also be installed for a single server invocation with the `--plugin-load` option. Plugins installed this way are not recorded in the `plugin` table. See [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

MySQL supports an API for client plugins in addition to that for server plugins. This is used, for example, by authentication plugins where a server-side plugin and a client-side plugin cooperate to enable clients to connect to the server through a variety of authentication methods.

### Additional Resources

The book *MySQL 5.1 Plugin Development* by Sergei Golubchik and Andrew Hutchings provides a wealth of detail about the plugin API. Despite the fact that the book's title refers to MySQL Server 5.1, most of the information in it applies to later versions as well.

#### 28.2.1 Types of Plugins

The plugin API enables creation of plugins that implement several capabilities:

- [Storage engines](#)
- [Full-text parsers](#)
- [Daemons](#)
- [INFORMATION\\_SCHEMA tables](#)
- [Semisynchronous replication](#)
- [Auditing](#)
- [Authentication](#)
- [Password validation and strength checking](#)
- [Protocol tracing](#)
- [Query rewriting](#)
- [Secure keyring storage and retrieval](#)

The following sections provide an overview of these plugin types.

#### Storage Engine Plugins

The pluggable storage engine architecture used by MySQL Server enables storage engines to be written as plugins and loaded into and unloaded from a running server. For a description of this architecture, see [Section 15.11, “Overview of MySQL Storage Engine Architecture”](#).

For information on how to use the plugin API to write storage engines, see [MySQL Internals: Writing a Custom Storage Engine](#).

## Full-Text Parser Plugins

MySQL has a built-in parser that it uses by default for full-text operations (parsing text to be indexed, or parsing a query string to determine the terms to be used for a search). The built-in full-text parser is supported with [InnoDB](#) and [MyISAM](#) tables.

MySQL also has a character-based ngram full-text parser that supports Chinese, Japanese, and Korean (CJK), and a word-based MeCab parser plugin that supports Japanese, for use with [InnoDB](#) and [MyISAM](#) tables.

For full-text processing, “parsing” means extracting words (or “tokens”, in the case of an n-gram character-based parser) from text or a query string based on rules that define which character sequences make up a word and where word boundaries lie.

When parsing for indexing purposes, the parser passes each word to the server, which adds it to a full-text index. When parsing a query string, the parser passes each word to the server, which accumulates the words for use in a search.

The parsing properties of the built-in full-text parser are described in [Section 12.9, “Full-Text Search Functions”](#). These properties include rules for determining how to extract words from text. The parser is influenced by certain system variables that cause words shorter or longer to be excluded, and by the stopword list that identifies common words to be ignored. For more information, see [Section 12.9.4, “Full-Text Stopwords”](#), and [Section 12.9.6, “Fine-Tuning MySQL Full-Text Search”](#).

The plugin API enables you to use a full-text parser other than the default built-in full-text parser. For example, if you are working with Japanese, you may choose to use the MeCab full-text parser. The plugin API also enables you to provide a full-text parser of your own so that you have control over the basic duties of a parser. A parser plugin can operate in either of two roles:

- The plugin can replace the built-in parser. In this role, the plugin reads the input to be parsed, splits it up into words, and passes the words to the server (either for indexing or for token accumulation). The ngram and MeCab parsers operate as replacements for the built-in full-text parser.

You may choose to provide your own full-text parser if you need to use different rules from those of the built-in parser for determining how to split up input into words. For example, the built-in parser considers the text “case-sensitive” to consist of two words “case” and “sensitive,” whereas an application might need to treat the text as a single word.

- The plugin can act in conjunction with the built-in parser by serving as a front end for it. In this role, the plugin extracts text from the input and passes the text to the parser, which splits up the text into words using its normal parsing rules. This parsing is affected by the `innodb_ft_xxx` or `ft_xxx` system variables and the stopword list.

One reason to use a parser this way is that you need to index content such as PDF documents, XML documents, or `.doc` files. The built-in parser is not intended for those types of input but a plugin can pull out the text from these input sources and pass it to the built-in parser.

It is also possible for a parser plugin to operate in both roles. That is, it could extract text from noncleartext input (the front end role), and also parse the text into words (thus replacing the built-in parser).

A full-text plugin is associated with full-text indexes on a per-index basis. That is, when you install a parser plugin initially, that does not cause it to be used for any full-text operations. It simply becomes available. For example, a full-text parser plugin becomes available to be named in a `WITH PARSER` clause when creating individual `FULLTEXT` indexes. To create such an index at table-creation time, do this:

```
CREATE TABLE t
```

```
(  
  doc CHAR(255),  
  FULLTEXT INDEX (doc) WITH PARSEr parser_name  
) ENGINE=InnoDB;
```

Or you can add the index after the table has been created:

```
ALTER TABLE t ADD FULLTEXT INDEX (doc) WITH PARSEr parser_name;
```

The only SQL change for associating the parser with the index is the `WITH PARSEr` clause. Searches are specified as before, with no changes needed for queries.

When you associate a parser plugin with a `FULLTEXT` index, the plugin is required for using the index. If the parser plugin is dropped, any index associated with it becomes unusable. Any attempt to use a table for which a plugin is not available results in an error, although `DROP TABLE` is still possible.

For more information about full-text plugins, see [Section 28.2.4.4, “Writing Full-Text Parser Plugins”](#). MySQL 5.7 supports full-text plugins with `MyISAM` and `InnoDB`.

## Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. MySQL distributions include an example daemon plugin that writes periodic heartbeat messages to a file.

For more information about daemon plugins, see [Section 28.2.4.5, “Writing Daemon Plugins”](#).

## INFORMATION\_SCHEMA Plugins

`INFORMATION_SCHEMA` plugins enable the creation of tables containing server metadata that are exposed to users through the `INFORMATION_SCHEMA` database. For example, `InnoDB` uses `INFORMATION_SCHEMA` plugins to provide tables that contain information about current transactions and locks.

For more information about `INFORMATION_SCHEMA` plugins, see [Section 28.2.4.6, “Writing INFORMATION\\_SCHEMA Plugins”](#).

## Semisynchronous Replication Plugins

MySQL replication is asynchronous by default. With semisynchronous replication, a commit performed on the master side blocks before returning to the session that performed the transaction until at least one slave acknowledges that it has received and logged the events for the transaction. Semisynchronous replication is implemented through complementary master and client plugins. See [Section 16.3.9, “Semisynchronous Replication”](#).

For more information about semisynchronous replication plugins, see [Section 28.2.4.7, “Writing Semisynchronous Replication Plugins”](#).

## Audit Plugins

The MySQL server provides a pluggable audit interface that enables information about server operations to be reported to interested parties. Audit notification occurs for these operations (although the interface is general and the server could be modified to report others):

- Write a message to the general query log (if the log is enabled)
- Write a message to the error log
- Send a query result to a client

Audit plugins may register with the audit interface to receive notification about server operations. When an auditable event occurs within the server, the server determines whether notification is needed. For each registered audit plugin, the server checks the event against those event classes in which the plugin is interested and passes the event to the plugin if there is a match.

This interface enables audit plugins to receive notifications only about operations in event classes they consider significant and to ignore others. The interface provides for categorization of operations into event classes and further division into event subclasses within each class.

When an audit plugin is notified of an auditable event, it receives a pointer to the current THD structure and a pointer to a structure that contains information about the event. The plugin can examine the event and perform whatever auditing actions are appropriate. For example, the plugin can see what statement produced a result set or was logged, the number of rows in a result, who the current user was for an operation, or the error code for failed operations.

For more information about audit plugins, see [Section 28.2.4.8, “Writing Audit Plugins”](#).

## Authentication Plugins

MySQL supports pluggable authentication. Authentication plugins exist on both the server and client sides. Plugins on the server side implement authentication methods for use by clients when they connect to the server. A plugin on the client side communicates with a server-side plugin to provide the authentication information that it requires. A client-side plugin may interact with the user, performing tasks such as soliciting a password or other authentication credentials to be sent to the server. See [Section 6.3.9, “Pluggable Authentication”](#).

Pluggable authentication also enables proxy user capability, in which one user takes the identity of another user. A server-side authentication plugin can return to the server the name of the user whose identity the connecting user should have. See [Section 6.3.10, “Proxy Users”](#).

For more information about authentication plugins, see [Section 28.2.4.9, “Writing Authentication Plugins”](#).

## Password-Validation Plugins

The MySQL server provides an interface for writing plugins that test passwords. Such a plugin implements two capabilities:

- Rejection of too-weak passwords in statements that assign passwords (such as `CREATE USER` and `ALTER USER` statements), and passwords given as arguments to the `PASSWORD( )` and `OLD_PASSWORD( )` functions.
- Assessing the strength of potential passwords for the `VALIDATE_PASSWORD_STRENGTH( )` SQL function.

For information about writing this type of plugin, see [Section 28.2.4.10, “Writing Password-Validation Plugins”](#).

## Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol. This capability can be used in MySQL 5.7.2 and up.

For more information about protocol trace plugins, see [Section 28.2.4.11, “Writing Protocol Trace Plugins”](#).

## Query Rewrite Plugins

As of MySQL 5.7.6, MySQL Server supports query rewrite plugins that can examine and possibly modify statements received by the server before the server executes them. A query rewrite plugin takes statements either before or after the server has parsed them.

A preparse query rewrite plugin has these characteristics:

- The plugin enables rewriting of SQL statements arriving at the server before the server processes them.

- The plugin receives a statement string and may return a different string.

A postparse query rewrite plugin has these characteristics:

- The plugin enables statement rewriting based on parse trees.
- The server parses each statement and passes its parse tree to the plugin, which may traverse the tree. The plugin can return the original tree to the server for further processing, or construct a different tree and return that instead.
- The plugin can use the `mysql_parser` plugin service for these purposes:
  - To activate statement digest calculation and obtain the normalized version of statements independent of whether the Performance Schema produces digests.
  - To traverse parse trees.
  - To parse statements. This is useful if the plugin constructs a new statement string from the parse tree. The plugin can have the server parse the string to produce a new tree, then return that tree as the representation of the rewritten statement.

For more information about plugin services, see [Section 28.3, “MySQL Services for Plugins”](#).

Preparse and postparse query rewrite plugins share these characteristics:

- If a query rewrite plugin is installed, the `--log-raw` option affects statement logging as follows:
  - Without `--log-raw`, the server logs the statement returned by the query rewrite plugin. This may differ from the statement as received.
  - With `--log-raw`, the server logs the original statement as received.
- If a plugin rewrites a statement, the server decides whether to write it to the binary log (and thus to any replication slaves) based on the rewritten statement, not the original statement. If a plugin rewrites only `SELECT` statements to `SELECT` statements, there is no impact on binary logging because the server does not write `SELECT` statements to the binary log.
- If a plugin rewrites a statement, the server produces a `Note` message that the client can view using `SHOW WARNINGS`. Messages have this format, where `stmt_in` is the original statement and `stmt_out` is the rewritten statement:

```
Query 'stmt_in' rewritten to 'stmt_out' by a query rewrite plugin
```

MySQL distributions include a postparse query rewrite plugin named `Rewriter`. This plugin is rule based. You can add rows to its rules table to cause `SELECT` statement rewriting. For more information, see [Section 5.5.4, “The Rewriter Query Rewrite Plugin”](#).

Query rewrite plugins use the same API as audit plugins. For more information about audit plugins, see [Section 28.2.4.8, “Writing Audit Plugins”](#).

## Keyring Plugins

As of MySQL 5.7.11, MySQL Server supports keyring plugins that enable internal server components and plugins to securely store sensitive information for later retrieval.

All MySQL distributions include a keyring plugin named `keyring_file`. MySQL Enterprise Edition distributions include additional keyring plugins. See [Section 6.5.4, “The MySQL Keyring”](#).

For more information about keyring plugins, see [Section 28.2.4.12, “Writing Keyring Plugins”](#).

## 28.2.2 Plugin API Characteristics

The server plugin API has these characteristics:

- All plugins have several things in common.

Each plugin has a name that it can be referred to in SQL statements, as well as other metadata such as an author and a description that provide other information. This information can be examined in the [INFORMATION\\_SCHEMA.PLUGINS](#) table or using the [SHOW PLUGINS](#) statement.

- The plugin framework is extendable to accommodate different kinds of plugins.

Although some aspects of the plugin API are common to all types of plugins, the API also permits type-specific interface elements so that different types of plugins can be created. A plugin with one purpose can have an interface most appropriate to its own requirements and not the requirements of some other plugin type.

Interfaces for several types of plugins exist, such as storage engines, full-text parser, and [INFORMATION\\_SCHEMA](#) tables. Others can be added.

- Plugins can expose information to users.

A plugin can implement system and status variables that are available through the [SHOW VARIABLES](#) and [SHOW STATUS](#) statements.

- The plugin API includes versioning information.

The version information included in the plugin API enables a plugin library and each plugin that it contains to be self-identifying with respect to the API version that was used to build the library. If the API changes over time, the version numbers will change, but a server can examine a given plugin library's version information to determine whether it supports the plugins in the library.

There are two types of version numbers. The first is the version for the general plugin framework itself. Each plugin library includes this kind of version number. The second type of version applies to individual plugins. Each specific type of plugin has a version for its interface, so each plugin in a library has a type-specific version number. For example, a library containing a full-text parser plugin has a general plugin API version number, and the plugin has a version number specific to the full-text plugin interface.

- The plugin API implements security restrictions.

A plugin library must be installed in a specific dedicated directory for which the location is controlled by the server and cannot be changed at runtime. Also, the library must contain specific symbols that identify it as a plugin library. The server will not load something as a plugin if it was not built as a plugin.

- Plugins have access to server services.

The services interface exposes server functionality that plugins can access using ordinary function calls. For details, see [Section 28.3, “MySQL Services for Plugins”](#).

In some respects, the server plugin API is similar to the older user-defined function (UDF) API that it supersedes, but the plugin API has several advantages over the older interface. For example, UDFs had no versioning information. Also, the newer plugin interface eliminates the security issues of the older UDF interface. The older interface for writing nonplugin UDFs permitted libraries to be loaded from any directory searched by the system's dynamic linker, and the symbols that identified the UDF library were relatively nonspecific.

The client plugin API has similar architectural characteristics, but client plugins have no direct access to the server the way server plugins do.

## 28.2.3 Plugin API Components

The server plugin implementation comprises several components.

SQL statements:

- `INSTALL PLUGIN` registers a plugin in the `mysql.plugin` table and loads the plugin code.
- `UNINSTALL PLUGIN` unregisters a plugin from the `mysql.plugin` table and unloads the plugin code.
- The `WITH PARSER` clause for full-text index creation associates a full-text parser plugin with a given `FULLTEXT` index.
- `SHOW PLUGINS` displays information about server plugins.

Command-line options and system variables:

- The `--plugin-load` option enables plugins to be loaded at server startup time.
- The `plugin_dir` system variable indicates the location of the directory where all plugins must be installed. The value of this variable can be specified at server startup with a `--plugin_dir=dir_name` option. `mysql_config --plugindir` displays the default plugin directory path name.

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

Plugin-related tables:

- The `INFORMATION_SCHEMA.PLUGINS` table contains plugin information.
- The `mysql.plugin` table lists each plugin that was installed with `INSTALL PLUGIN` and is required for plugin use. For new MySQL installations, this table is created during the installation process.

The client plugin implementation is simpler:

- For the `mysql_options()` C API function, the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options enable client programs to load authentication plugins.
- There are C API functions that enable management of client plugins.

To examine how MySQL implements plugins, consult the following source files in a MySQL source distribution:

- In the `include/mysql` directory, `plugin.h` exposes the public plugin API. This file should be examined by anyone who wants to write a plugin library. `plugin_xxx.h` files provide additional information that pertains to specific types of plugins. `client_plugin.h` contains information specific to client plugins.
- In the `sql` directory, `sql_plugin.h` and `sql_plugin.cc` comprise the internal plugin implementation. `sql_acl.cc` is where the server uses authentication plugins. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.
- In the `sql-common` directory, `client_plugin.h` implements the C API client plugin functions, and `client.c` implements client authentication support. These files need not be consulted by plugin developers. They may be of interest for those who want to know more about how the server handles plugins.

## 28.2.4 Writing Plugins

To create a plugin library, you must provide the required descriptor information that indicates what plugins the library file contains, and write the interface functions for each plugin.

Every server plugin must have a general descriptor that provides information to the plugin API, and a type-specific descriptor that provides information about the plugin interface for a given type of plugin. The structure of the general descriptor is the same for all plugin types. The structure of the type-specific descriptor varies among plugin types and is determined by the requirements of what the plugin needs to do. The server plugin interface also enables plugins to expose status and system variables.

These variables become visible through the `SHOW STATUS` and `SHOW VARIABLES` statements and the corresponding `INFORMATION_SCHEMA` tables.

For client-side plugins, the architecture is a bit different. Each plugin must have a descriptor, but there is no division into separate general and type-specific descriptors. Instead, the descriptor begins with a fixed set of members common to all client plugin types, and the common members are followed by any additional members required to implement the specific plugin type.

You can write plugins in C or C++ (or another language that can use C calling conventions). Plugins are loaded and unloaded dynamically, so your operating system must support dynamic loading and you must have compiled the calling application dynamically (not statically). For server plugins, this means that `mysqld` must be linked dynamically.

A server plugin contains code that becomes part of the running server, so when you write the plugin, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to plugins originally written for older servers. For information about these constraints, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), and [Section 2.9.5, “Dealing with Problems Compiling MySQL”](#).

Client plugin writers should avoid dependencies on what symbols the calling application has because you cannot be sure what applications will use the plugin.

### 28.2.4.1 Overview of Plugin Writing

The following procedure provides an overview of the steps needed to create a plugin library. The next sections provide additional details on setting plugin data structures and writing specific types of plugins.

1. In the plugin source file, include the header files that the plugin library needs. The `plugin.h` file is required, and the library might require other files as well. For example:

```
#include <stdlib.h>
#include <ctype.h>
#include <mysql/plugin.h>
```

2. Set up the descriptor information for the plugin library file. For server plugins, write the library descriptor, which must contain the general plugin descriptor for each server plugin in the file. For more information, see [Server Plugin Library and Plugin Descriptors](#). In addition, set up the type-specific descriptor for each server plugin in the library. Each plugin's general descriptor points to its type-specific descriptor.

For client plugins, write the client descriptor. For more information, see [Client Plugin Descriptors](#).

3. Write the plugin interface functions for each plugin. For example, each plugin's general plugin descriptor points to the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. The plugin's type-specific description may also point to interface functions.
4. For server plugins, set up the status and system variables, if there are any.
5. Compile the plugin library as a shared library and install it in the plugin directory. For more information, see [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#).
6. For server plugins, register the plugin with the server. For more information, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).
7. Test the plugin to verify that it works properly.

### 28.2.4.2 Plugin Data Structures

A plugin library file includes descriptor information to indicate what plugins it contains.

If the plugin library contains any server plugins, it must include the following descriptor information:

- A library descriptor indicates the general server plugin API version number used by the library and contains a general plugin descriptor for each server plugin in the library. To provide the framework for this descriptor, invoke two macros from the `plugin.h` header file:

```
mysql_declare_plugin(name)
... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

The macros expand to provide a declaration for the API version automatically. You must provide the plugin descriptors.

- Within the library descriptor, each general server plugin is described by a `st_mysql_plugin` structure. This plugin descriptor structure contains information that is common to every type of server plugin: A value that indicates the plugin type; the plugin name, author, description, and license type; pointers to the initialization and deinitialization functions that the server invokes when it loads and unloads the plugin, and pointers to any status or system variables the plugin implements.
- Each general server plugin descriptor within the library descriptor also contains a pointer to a type-specific plugin descriptor. The structure of the type-specific descriptors varies from one plugin type to another because each type of plugin can have its own API. A type-specific plugin descriptor contains a type-specific API version number and pointers to the functions that are needed to implement that plugin type. For example, a full-text parser plugin has initialization and deinitialization functions, and a main parsing function. The server invokes these functions when it uses the plugin to parse text.

The plugin library also contains the interface functions that are referenced by the general and type-specific descriptors for each plugin in the library.

If the plugin library contains a client plugin, it must include a descriptor for the plugin. The descriptor begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type. To provide the descriptor framework, invoke two macros from the `client_plugin.h` header file:

```
mysql_declare_client_plugin(plugin_type)
... members common to all client plugins ...
... type-specific extra members ...
mysql_end_client_plugin;
```

The plugin library also contains any interface functions referenced by the client descriptor.

The `mysql_declare_plugin()` and `mysql_declare_client_plugin()` macros differ somewhat in how they can be invoked, which has implications for the contents of plugin libraries. The following guidelines summarize the rules:

- `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can both be used in the same source file, which means that a plugin library can contain both server and client plugins. However, each of `mysql_declare_plugin()` and `mysql_declare_client_plugin()` can be used at most once.
- `mysql_declare_plugin()` permits multiple server plugin declarations, so a plugin library can contain multiple server plugins.
- `mysql_declare_client_plugin()` permits only a single client plugin declaration. To create multiple client plugins, separate plugin libraries must be used.

When a client program looks for a client plugin that is in a plugin library and not built into `libmysqlclient`, it looks for a file with a base name that is the same as the plugin name. For example, if a program needs to use a client authentication plugin named `auth_xxx` on a system that uses `.so` as the library suffix, it looks in the file named `auth_xxx.so`. (On OS X, the program looks first for `auth_xxx.dylib`, then for `auth_xxx.so`.) For this reason, if a plugin library contains a client plugin, the library must have the same base name as that plugin.

The same is not true for a library that contains server plugins. The `--plugin-load` option and the `INSTALL PLUGIN` statement provide the library file name explicitly, so there need be no explicit relationship between the library name and the name of any server plugins it contains.

## Server Plugin Library and Plugin Descriptors

Every plugin library that contains server plugins must include a library descriptor that contains the general plugin descriptor for each server plugin in the file. This section discusses how to write the library and general descriptors for server plugins.

The library descriptor must define two symbols:

- `_mysql_plugin_interface_version` specifies the version number of the general plugin framework. This is given by the `MYSQL_PLUGIN_INTERFACE_VERSION` symbol, which is defined in the `plugin.h` file.
- `_mysql_plugin_declarations` defines an array of plugin declarations, terminated by a declaration with all members set to 0. Each declaration is an instance of the `st_mysql_plugin` structure (also defined in `plugin.h`). There must be one of these for each server plugin in the library.

If the server does not find those two symbols in a library, it does not accept it as a legal plugin library and rejects it with an error. This prevents use of a library for plugin purposes unless it was built specifically as a plugin library.

The conventional way to define the two required symbols is by using the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros from the `plugin.h` file:

```
mysql_declare_plugin(name)
... one or more server plugin descriptors here ...
mysql_declare_plugin_end;
```

Each server plugin must have a general descriptor that provides information to the server plugin API. The general descriptor has the same structure for all plugin types. The `st_mysql_plugin` structure in the `plugin.h` file defines this descriptor:

```
struct st_mysql_plugin
{
    int type;           /* the plugin type (a MYSQL_XXX_PLUGIN value) */
    void *info;         /* pointer to type-specific plugin descriptor */
    const char *name;   /* plugin name */
    const char *author; /* plugin author (for I_S.PLUGINS) */
    const char *descr;  /* general descriptive text (for I_S.PLUGINS) */
    int license;        /* the plugin license (PLUGIN_LICENSE_XXX) */
    int (*init)(void *); /* the function to invoke when plugin is loaded */
    int (*deinit)(void *); /* the function to invoke when plugin is unloaded */
    unsigned int version; /* plugin version (for I_S.PLUGINS) */
    struct st_mysql_show_var *status_vars;
    struct st_mysql_sys_var **system_vars;
    void * __reserved1; /* reserved for dependency checking */
    unsigned long flags; /* flags for plugin */
};
```

The `st_mysql_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `plugin.h`:

```
/*
 * The allowable types of plugins
 */
#define MYSQL_UDF_PLUGIN      0 /* User-defined function */
#define MYSQL_STORAGE_ENGINE_PLUGIN 1 /* Storage Engine */
#define MYSQL_FTPARSER_PLUGIN 2 /* Full-text parser plugin */
#define MYSQL_DAEMON_PLUGIN  3 /* The daemon/raw plugin type */
```

```
#define MYSQL_INFORMATION_SCHEMA_PLUGIN 4 /* The I_S plugin type */
#define MYSQL_AUDIT_PLUGIN 5 /* The Audit plugin type */
#define MYSQL_REPLICATION_PLUGIN 6 /* The replication plugin type */
#define MYSQL_AUTHENTICATION_PLUGIN 7 /* The authentication plugin type */
...
```

For example, for a full-text parser plugin, the `type` value is `MYSQL_FTPARSER_PLUGIN`.

- **info**: A pointer to the type-specific descriptor for the plugin. This descriptor's structure depends on the particular type of plugin, unlike that of the general plugin descriptor structure. For version-control purposes, the first member of the type-specific descriptor for every plugin type is expected to be the interface version for the type. This enables the server to check the type-specific version for every plugin no matter its type. Following the version number, the descriptor includes any other members needed, such as callback functions and other information needed by the server to invoke the plugin properly. Later sections on writing particular types of server plugins describe the structure of their type-specific descriptors.
- **name**: A string that gives the plugin name. This is the name that will be listed in the `mysql.plugin` table and by which you refer to the plugin in SQL statements such as `INSTALL PLUGIN` and `UNINSTALL PLUGIN`, or with the `--plugin-load` option. The name is also visible in the `INFORMATION_SCHEMA.PLUGINS` table or the output from `SHOW PLUGINS`.

The plugin name should not begin with the name of any server option. If it does, the server will fail to initialize it. For example, the server has a `--socket` option, so you should not use a plugin name such as `socket`, `socket_plugin`, and so forth.

- **author**: A string naming the plugin author. This can be whatever you like.
- **desc**: A string that provides a general description of the plugin. This can be whatever you like.
- **license**: The plugin license type. The value can be one of `PLUGIN_LICENSE_PROPRIETARY`, `PLUGIN_LICENSE_GPL`, or `PLUGIN_LICENSE_BSD`.
- **init**: A once-only initialization function, or `NULL` if there is no such function. The server executes this function when it loads the plugin, which happens for `INSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server startup. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.
- **deinit**: A once-only deinitialization function, or `NULL` if there is no such function. The server executes this function when it unloads the plugin, which happens for `UNINSTALL PLUGIN` or, for plugins listed in the `mysql.plugin` table, at server shutdown. The function takes one argument that points to the internal structure used to identify the plugin. It returns zero for success and nonzero for failure.
- **version**: The plugin version number. When the plugin is installed, this value can be retrieved from the `INFORMATION_SCHEMA.PLUGINS` table. The value includes major and minor numbers. If you write the value as a hex constant, the format is `0xMMNN`, where `MM` and `NN` are the major and minor numbers, respectively. For example, `0x0302` represents version 3.2.
- **status\_vars**: A pointer to a structure for status variables associated with the plugin, or `NULL` if there are no such variables. When the plugin is installed, these variables are displayed in the output of the `SHOW STATUS` statement.

The `status_vars` member, if not `NULL`, points to an array of `st_mysql_show_var` structures that describe status variables. See [Server Plugin Status and System Variables](#).

- **system\_vars**: A pointer to a structure for system variables associated with the plugin, or `NULL` if there are no such variables. These options and system variables can be used to help initialize variables within the plugin. When the plugin is installed, these variables are displayed in the output of the `SHOW VARIABLES` statement.

The `system_vars` member, if not `NULL`, points to an array of `st_mysql_sys_var` structures that describe system variables. See [Server Plugin Status and System Variables](#).

- `__reserved1`: A placeholder for the future. It should be set to `NULL`.
- `flags`: Plugin flags. Individual bits correspond to different flags. The value should be set to the OR of the applicable flags. These flags are available:

```
#define PLUGIN_OPT_NO_INSTALL 1UL /* Not dynamically loadable */
#define PLUGIN_OPT_NO_UNINSTALL 2UL /* Not dynamically unloadable */
```

`PLUGIN_OPT_NO_INSTALL` indicates that the plugin cannot be loaded at runtime with the `INSTALL PLUGIN` statement. This is appropriate for plugins that must be loaded at server startup with the `--plugin-load` option. `PLUGIN_OPT_NO_UNINSTALL` indicates that the plugin cannot be unloaded at runtime with the `UNINSTALL PLUGIN` statement.

The server invokes the `init` and `deinit` functions in the general plugin descriptor only when loading and unloading the plugin. They have nothing to do with use of the plugin such as happens when an SQL statement causes the plugin to be invoked.

For example, the descriptor information for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN, /* type */
    &simple_parser_descriptor, /* descriptor */
    "simple_parser", /* name */
    "Oracle Corporation", /* author */
    "Simple Full-Text Parser", /* description */
    PLUGIN_LICENSE_GPL, /* plugin license */
    simple_parser_plugin_init, /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001, /* version */
    simple_status, /* status variables */
    simple_system_variables, /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;
```

For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

`plugin.h` defines the `mysql_declare_plugin()` and `mysql_declare_plugin_end` macros like this:

```
#ifndef MYSQL_DYNAMIC_PLUGIN
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int VERSION= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int PSIZE= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin DECLS[]= {
#else
#define __MYSQL_DECLARE_PLUGIN(NAME, VERSION, PSIZE, DECLS) \
MYSQL_PLUGIN_EXPORT int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION; \
MYSQL_PLUGIN_EXPORT int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin); \
MYSQL_PLUGIN_EXPORT struct st_mysql_plugin _mysql_plugin_declarations[]= {
#endif

#define mysql_declare_plugin(NAME) \
__MYSQL_DECLARE_PLUGIN(NAME, \
    builtin_ ## NAME ## _plugin_interface_version, \
    builtin_ ## NAME ## _sizeof_struct_st_plugin, \
    builtin_ ## NAME ## _plugin)

#define mysql_declare_plugin_end ,{0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0}}
```

**Note**

Those declarations define the `_mysql_plugin_interface_version_` symbol only if the `MYSQL_DYNAMIC_PLUGIN` symbol is defined. This means that `-DMYSQL_DYNAMIC_PLUGIN` must be provided as part of the compilation command to build the plugin as a shared library.

When the macros are used as just shown, they expand to the following code, which defines both of the required symbols (`_mysql_plugin_interface_version_` and `_mysql_plugin_declarations_`):

```
int _mysql_plugin_interface_version= MYSQL_PLUGIN_INTERFACE_VERSION;
int _mysql_sizeof_struct_st_plugin= sizeof(struct st_mysql_plugin);
struct st_mysql_plugin _mysql_plugin_declarations[]= {
{
    MYSQL_FTPARSER_PLUGIN,          /* type */
    &simple_parser_descriptor,       /* descriptor */
    "simple_parser",                 /* name */
    "Oracle Corporation",           /* author */
    "Simple Full-Text Parser",       /* description */
    PLUGIN_LICENSE_GPL,             /* plugin license */
    simple_parser_plugin_init,       /* init function (when loaded) */
    simple_parser_plugin_deinit,     /* deinit function (when unloaded) */
    0x0001,                         /* version */
    simple_status,                  /* status variables */
    simple_system_variables,         /* system variables */
    NULL,
    0
}
, {0,0,0,0,0,0,0,0,0,0,0,0,0,0}}
};
```

The preceding example declares a single plugin in the general descriptor, but it is possible to declare multiple plugins. List the declarations one after the other between `mysql_declare_plugin()` and `mysql_declare_plugin_end`, separated by commas.

MySQL server plugins can be written in C or C++ (or another language that can use C calling conventions). If you write a C++ plugin, one C++ feature that you should not use is nonconstant variables to initialize global structures. Members of structures such as the `st_mysql_plugin` structure should be initialized only with constant variables. The `simple_parser` descriptor shown earlier is permissible in a C++ plugin because it satisfies that requirement:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,          /* type */
    &simple_parser_descriptor,       /* descriptor */
    "simple_parser",                 /* name */
    "Oracle Corporation",           /* author */
    "Simple Full-Text Parser",       /* description */
    PLUGIN_LICENSE_GPL,             /* plugin license */
    simple_parser_plugin_init,       /* init function (when loaded) */
    simple_parser_plugin_deinit,     /* deinit function (when unloaded) */
    0x0001,                         /* version */
    simple_status,                  /* status variables */
    simple_system_variables,         /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;
```

Here is another valid way to write the general descriptor. It uses constant variables to indicate the plugin name, author, and description:

```
const char *simple_parser_name = "simple_parser";
const char *simple_parser_author = "Oracle Corporation";
```

```

const char *simple_parser_description = "Simple Full-Text Parser";

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    simple_parser_name,          /* name */
    simple_parser_author,        /* author */
    simple_parser_description,   /* description */
    PLUGIN_LICENSE_GPL,         /* plugin license */
    simple_parser_plugin_init,    /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                     /* version */
    simple_status,               /* status variables */
    simple_system_variables,     /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;

```

However, the following general descriptor is invalid. It uses structure members to indicate the plugin name, author, and description, but structures are not considered constant initializers in C++:

```

typedef struct
{
    const char *name;
    const char *author;
    const char *description;
} plugin_info;

plugin_info parser_info = {
    "simple_parser",
    "Oracle Corporation",
    "Simple Full-Text Parser"
};

mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    parser_info.name,           /* name */
    parser_info.author,         /* author */
    parser_info.description,    /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init,   /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status,              /* status variables */
    simple_system_variables,     /* system variables */
    NULL,
    0
}
mysql_declare_plugin_end;

```

## Server Plugin Status and System Variables

The server plugin interface enables plugins to expose status and system variables using the [status\\_vars](#) and [system\\_vars](#) members of the general plugin descriptor.

The [status\\_vars](#) member of the general plugin descriptor, if not 0, points to an array of [st\\_mysql\\_show\\_var](#) structures, each of which describes one status variable, followed by a structure with all members set to 0. The [st\\_mysql\\_show\\_var](#) structure has this definition:

```

struct st_mysql_show_var {
    const char *name;
    char *value;
    enum enum_mysql_show_type type;
};

```

The following table shows the permissible status variable `type` values and what the corresponding variable should be.

**Table 28.1 Server Plugin Status Variable Types**

Variable Type	Meaning
<code>SHOW_BOOL</code>	Pointer to a boolean variable
<code>SHOW_INT</code>	Pointer to an integer variable
<code>SHOW_LONG</code>	Pointer to a long integer variable
<code>SHOW_LONGLONG</code>	Pointer to a longlong integer variable
<code>SHOW_CHAR</code>	A string
<code>SHOW_CHAR_PTR</code>	Pointer to a string
<code>SHOW_ARRAY</code>	Pointer to another <code>st_mysql_show_var</code> array
<code>SHOW_FUNC</code>	Pointer to a function
<code>SHOW_DOUBLE</code>	Pointer to a double

For the `SHOW_FUNC` type, the function is called and fills in its `out` parameter, which then provides information about the variable to be displayed. The function has this signature:

```
#define SHOW_VAR_FUNC_BUFF_SIZE 1024

typedef int (*mysql_show_var_func) (void *thd,
                                   struct st_mysql_show_var *out,
                                   char *buf);
```

The `system_vars` member, if not 0, points to an array of `st_mysql_sys_var` structures, each of which describes one system variable (which can also be set from the command-line or configuration file), followed by a structure with all members set to 0. The `st_mysql_sys_var` structure is defined as follows:

```
struct st_mysql_sys_var {
    int flags;
    const char *name, *comment;
    int (*check)(THD*, struct st_mysql_sys_var *, void*, st_mysql_value*);
    void (*update)(THD*, struct st_mysql_sys_var *, void*, const void*);
};
```

Additional fields are append as required depending upon the flags.

For convenience, a number of macros are defined that make creating new system variables within a plugin much simpler.

Throughout the macros, the following fields are available:

- `name`: An unquoted identifier for the system variable.
- `varname`: The identifier for the static variable. Where not available, it is the same as the `name` field.
- `opt`: Additional use flags for the system variable. The following table shows the permissible flags.

**Table 28.2 Server Plugin System Variable Flags**

Flag Value	Description
<code>PLUGIN_VAR_READONLY</code>	The system variable is read only
<code>PLUGIN_VAR_NOSYSVAR</code>	The system variable is not user visible at runtime
<code>PLUGIN_VAR_NOCMDOPT</code>	The system variable is not configurable from the command line
<code>PLUGIN_VAR_NOCMDARG</code>	No argument is required at the command line (typically used for boolean variables)

Flag Value	Description
<code>PLUGIN_VAR_RQCMDARG</code>	An argument is required at the command line (this is the default)
<code>PLUGIN_VAR_OPCMDARG</code>	An argument is optional at the command line
<code>PLUGIN_VAR_MEMALLOC</code>	Used for string variables; indicates that memory is to be allocated for storage of the string

- `comment`: A descriptive comment to be displayed in the server help message. `NULL` if this variable is to be hidden.
- `check`: The check function, `NULL` for default.
- `update`: The update function, `NULL` for default.
- `default`: The variable default value.
- `minimum`: The variable minimum value.
- `maximum`: The variable maximum value.
- `blocksize`: The variable block size. When the value is set, it is rounded to the nearest multiple of `blocksize`.

A system variable may be accessed either by using the static variable directly or by using the `SYSVAR()` accessor macro. The `SYSVAR()` macro is provided for completeness. Usually it should be used only when the code cannot directly access the underlying variable.

For example:

```
static int my_foo;
static MYSQL_SYSVAR_INT(foo_var, my_foo,
                        PLUGIN_VAR_RQCMDARG, "foo comment",
                        NULL, NULL, 0, 0, INT_MAX, 0);

...
SYSVAR(foo_var)= value;
value= SYSVAR(foo_var);
my_foo= value;
value= my_foo;
```

Session variables may be accessed only through the `THDVAR()` accessor macro. For example:

```
static MYSQL_THDVAR_BOOL(some_flag,
                        PLUGIN_VAR_NOCMDARG, "flag comment",
                        NULL, NULL, FALSE);

...
if (THDVAR(thd, some_flag))
{
    do_something();
    THDVAR(thd, some_flag)= FALSE;
}
```

All global and session system variables must be published to `mysqld` before use. This is done by constructing a `NULL`-terminated array of the variables and linking to it in the plugin public interface. For example:

```
static struct st_mysql_sys_var *my_plugin_vars[]= {
    MYSQL_SYSVAR(foo_var),
    MYSQL_SYSVAR(some_flag),
    NULL
};
mysql_declare_plugin(fooplug)
{
    MYSQL_..._PLUGIN,
    &plugin_data,
```

```

"fooplug",
"foo author",
"This does foo!",
PLUGIN_LICENSE_GPL,
foo_init,
foo_fini,
0x0001,
NULL,
my_plugin_vars,
NULL,
0
}
mysql_declare_plugin_end;

```

The following convenience macros enable you to declare different types of system variables:

- Boolean system variables of type `my_bool`, which is a 1-byte boolean. (0 = FALSE, 1 = TRUE)

```

MYSQL_THDVAR_BOOL(name, opt, comment, check, update, default)
MYSQL_SYSVAR_BOOL(name, varname, opt, comment, check, update, default)

```

- String system variables of type `char*`, which is a pointer to a null-terminated string.

```

MYSQL_THDVAR_STR(name, opt, comment, check, update, default)
MYSQL_SYSVAR_STR(name, varname, opt, comment, check, update, default)

```

- Integer system variables, of which there are several varieties.

- An `int` system variable, which is typically a 4-byte signed word.

```

MYSQL_THDVAR_INT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_INT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)

```

- An `unsigned int` system variable, which is typically a 4-byte unsigned word.

```

MYSQL_THDVAR_UINT(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_UINT(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)

```

- A `long` system variable, which is typically either a 4- or 8-byte signed word.

```

MYSQL_THDVAR_LONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_LONG(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)

```

- An `unsigned long` system variable, which is typically either a 4- or 8-byte unsigned word.

```

MYSQL_THDVAR_ULONG(name, opt, comment, check, update, default, min, max, blk)
MYSQL_SYSVAR_ULONG(name, varname, opt, comment, check, update, default,
                 minimum, maximum, blocksize)

```

- A `long long` system variable, which is typically an 8-byte signed word.

```

MYSQL_THDVAR_LONGLONG(name, opt, comment, check, update,
                     default, minimum, maximum, blocksize)
MYSQL_SYSVAR_LONGLONG(name, varname, opt, comment, check, update,
                     default, minimum, maximum, blocksize)

```

- An `unsigned long long` system variable, which is typically an 8-byte unsigned word.

```

MYSQL_THDVAR_ULONGLONG(name, opt, comment, check, update,

```

```

                                default, minimum, maximum, blocksize)
MYSQL_SYSVAR_ULONGLONG(name, varname, opt, comment, check, update,
                                default, minimum, maximum, blocksize)

```

- A **double** system variable, which is typically an 8-byte signed word. These accessor macros were added in MySQL 5.7.2.

```

MYSQL_THDVAR_DOUBLE(name, opt, comment, check, update,
                                default, minimum, maximum, blocksize)
MYSQL_SYSVAR_DOUBLE(name, varname, opt, comment, check, update,
                                default, minimum, maximum, blocksize)

```

- An **unsigned long** system variable, which is typically either a 4- or 8-byte unsigned word. The range of possible values is an ordinal of the number of elements in the **typelib**, starting from 0.

```

MYSQL_THDVAR_ENUM(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_ENUM(name, varname, opt, comment, check, update,
                                default, typelib)

```

- An **unsigned long long** system variable, which is typically an 8-byte unsigned word. Each bit represents an element in the **typelib**.

```

MYSQL_THDVAR_SET(name, opt, comment, check, update, default, typelib)
MYSQL_SYSVAR_SET(name, varname, opt, comment, check, update,
                                default, typelib)

```

Internally, all mutable and plugin system variables are stored in a **HASH** structure.

Display of the server command-line help text is handled by compiling a **DYNAMIC\_ARRAY** of all variables relevant to command-line options, sorting them, and then iterating through them to display each option.

When a command-line option has been handled, it is then removed from the **argv** by the **handle\_option()** function (**my\_getopt.c**); in effect, it is consumed.

The server processes command-line options during the plugin installation process, immediately after the plugin has been successfully loaded but before the plugin initialization function has been called

Plugins loaded at runtime do not benefit from any configuration options and must have usable defaults. Once they are installed, they are loaded at **mysqld** initialization time and configuration options can be set at the command line or within **my.cnf**.

Plugins should consider the **thd** parameter to be read only.

## Client Plugin Descriptors

Each client plugin must have a descriptor that provides information to the client plugin API. The descriptor structure begins with a fixed set of members common to all client plugins, followed by any members specific to the plugin type.

The **st\_mysql\_client\_plugin** structure in the **client\_plugin.h** file defines a “generic” descriptor that contains the common members:

```

struct st_mysql_client_plugin
{
    int type;
    unsigned int interface_version;
    const char *name;
    const char *author;
    const char *desc;
    unsigned int version[3];
    const char *license;
    void *mysql_api;
}

```

```
int (*init)(char *, size_t, int, va_list);
int (*deinit)();
int (*options)(const char *option, const void *);
};
```

The common `st_mysql_client_plugin` descriptor structure members are used as follows. `char *` members should be specified as null-terminated strings.

- `type`: The plugin type. This must be one of the plugin-type values from `client_plugin.h`, such as `MYSQL_CLIENT_AUTHENTICATION_PLUGIN`.
- `interface_version`: The plugin interface version. For example, this is `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION` for an authentication plugin.
- `name`: A string that gives the plugin name. This is the name by which you refer to the plugin when you call `mysql_options()` with the `MYSQL_DEFAULT_AUTH` option or specify the `--default-auth` option to a MySQL client program.
- `author`: A string naming the plugin author. This can be whatever you like.
- `desc`: A string that provides a general description of the plugin. This can be whatever you like.
- `version`: The plugin version as an array of three integers indicating the major, minor, and teeny versions. For example, `{1,2,3}` indicates version 1.2.3.
- `license`: A string that specifies the license type.
- `mysql_api`: For internal use. Specify it as `NULL` in the plugin descriptor.
- `init`: A once-only initialization function, or `NULL` if there is no such function. The client library executes this function when it loads the plugin. The function returns zero for success and nonzero for failure.

The `init` function uses its first two arguments to return an error message if an error occurs. The first argument is a pointer to a `char` buffer, and the second argument indicates the buffer length. Any message returned by the `init` function must be null-terminated, so the maximum message length is the buffer length minus one. The next arguments are passed to `mysql_load_plugin()`. The first indicates how many more arguments there are (0 if none), followed by any remaining arguments.

- `deinit`: A once-only deinitialization function, or `NULL` if there is no such function. The client library executes this function when it unloads the plugin. The function takes no arguments. It returns zero for success and nonzero for failure.
- `options`: A function for handling options passed to the plugin, or `NULL` if there is no such function. The function takes two arguments representing the option name and a pointer to its value. The function returns zero for success and nonzero for failure.

For a given client plugin type, the common descriptor members may be followed by additional members necessary to implement plugins of that type. For example, the `st_mysql_client_plugin_AUTHENTICATION` structure for authentication plugins has a function at the end that the client library calls to perform authentication.

To declare a plugin, use the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros:

```
mysql_declare_client_plugin(plugin_type)
... members common to all client plugins ...
... type-specific extra members ...
mysql_end_client_plugin;
```

Do not specify the `type` or `interface_version` member explicitly. The `mysql_declare_client_plugin()` macro uses the `plugin_type` argument to generate their values automatically. For example, declare an authentication client plugin like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
    "my_auth_plugin",
    "Author Name",
    "My Client Authentication Plugin",
    {1,0,0},
    "GPL",
    NULL,
    my_auth_init,
    my_auth_deinit,
    my_auth_options,
    my_auth_main
mysql_end_client_plugin;
```

This declaration uses the `AUTHENTICATION` argument to set the `type` and `interface_version` members to `MYSQL_CLIENT_AUTHENTICATION_PLUGIN` and `MYSQL_CLIENT_AUTHENTICATION_PLUGIN_INTERFACE_VERSION`.

Depending on the plugin type, the descriptor may have other members following the common members. For example, for an authentication plugin, there is a function (`my_auth_main()` in the descriptor just shown) that handles communication with the server. See [Section 28.2.4.9, “Writing Authentication Plugins”](#).

Normally, a client program that supports the use of authentication plugins causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```
char *plugin_dir = "path_to_plugin_dir";
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 27.8.14, “C API Client Plugin Functions”](#).

### 28.2.4.3 Compiling and Installing Plugin Libraries

After your plugin is written, you must compile it and install it. The procedure for compiling shared objects varies from system to system. If you build your library using `CMake`, it should be able to generate the correct compilation commands for your system. If the library is named `somepluglib`, you should end up with a shared library file that has a name something like `somepluglib.so`. (The `.so` file name suffix might differ on your system.)

To use `CMake`, you'll need to set up the configuration files to enable the plugin to be compiled and installed. Use the plugin examples under the `plugin` directory of a MySQL source distribution as a guide.

Create `CMakeLists.txt`, which should look something like this:

```
MYSQL_ADD_PLUGIN(somepluglib somepluglib.c
    MODULE_ONLY MODULE_OUTPUT_NAME "somepluglib")
```

When `CMake` generates the `Makefile`, it should take care of passing to the compilation command the `-DMYSQL_DYNAMIC_PLUGIN` flag, and passing to the linker the `-lmysqlservices` flag, which is needed to link in any functions from services provided through the plugin services interface. See [Section 28.3, “MySQL Services for Plugins”](#).

Run `CMake`, then run `make`:

```
shell> cmake .
shell> make
```

If you need to specify configuration options to `CMake`, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), for a list. For example, you might want to specify `CMAKE_INSTALL_PREFIX` to indicate the MySQL base directory under which the plugin should be installed. You can see what value to use for this option with `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'basedir';
+-----+-----+
| Variable_name | Value                |
+-----+-----+
| base          | /usr/local/mysql    |
+-----+-----+
```

The location of the plugin directory where you should install the library is given by the `plugin_dir` system variable. For example:

```
mysql> SHOW VARIABLES LIKE 'plugin_dir';
+-----+-----+
| Variable_name | Value                                     |
+-----+-----+
| plugin_dir    | /usr/local/mysql/lib/mysql/plugin      |
+-----+-----+
```

To install the plugin library, use `make`:

```
shell> make install
```

Verify that `make install` installed the plugin library in the proper directory. After installing it, make sure that the library permissions permit it to be executed by the server.

#### 28.2.4.4 Writing Full-Text Parser Plugins

MySQL supports server-side full-text parser plugins with `MyISAM` and `InnoDB`. For introductory information about full-text parser plugins, see [Full-Text Parser Plugins](#).

A full-text parser plugin can be used to replace or modify the built-in full-text parser. This section describes how to write a full-text parser plugin named `simple_parser`. This plugin performs parsing based on simpler rules than those used by the MySQL built-in full-text parser: Words are nonempty runs of whitespace characters.

The instructions use the source code in the `plugin/fulltext` directory of MySQL source distributions, so change location into that directory. The following procedure describes how the plugin library is created:

1. To write a full-text parser plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_FTPARSER_PLUGIN` server plugin type and the data structures needed to declare the plugin.

2. Set up the library descriptor for the plugin library file.

This descriptor contains the general plugin descriptor for the server plugin. For a full-text parser plugin, the type must be `MYSQL_FTPARSER_PLUGIN`. This is the value that identifies the plugin as

being legal for use in a `WITH PARSER` clause when creating a `FULLTEXT` index. (No other plugin type is legal for this clause.)

For example, the library descriptor for a library that contains a single full-text parser plugin named `simple_parser` looks like this:

```
mysql_declare_plugin(ftexample)
{
    MYSQL_FTPARSER_PLUGIN,      /* type */
    &simple_parser_descriptor,    /* descriptor */
    "simple_parser",             /* name */
    "Oracle Corporation",       /* author */
    "Simple Full-Text Parser",  /* description */
    PLUGIN_LICENSE_GPL,        /* plugin license */
    simple_parser_plugin_init,   /* init function (when loaded) */
    simple_parser_plugin_deinit, /* deinit function (when unloaded) */
    0x0001,                    /* version */
    simple_status,              /* status variables */
    simple_system_variables,    /* system variables */
    NULL,                      /* */
    0
}
mysql_declare_plugin_end;
```

The `name` member (`simple_parser`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

For more information, see [Server Plugin Library and Plugin Descriptors](#).

### 3. Set up the type-specific plugin descriptor.

Each general plugin descriptor in the library descriptor points to a type-specific descriptor. For a full-text parser plugin, the type-specific descriptor is an instance of the `st_mysql_ftparser` structure in the `plugin.h` file:

```
struct st_mysql_ftparser
{
    int interface_version;
    int (*parse)(MYSQL_FTPARSER_PARAM *param);
    int (*init)(MYSQL_FTPARSER_PARAM *param);
    int (*deinit)(MYSQL_FTPARSER_PARAM *param);
};
```

As shown by the structure definition, the descriptor has an interface version number and contains pointers to three functions.

The interface version number is specified using a symbol, which is in the form: `MYSQL_XXX_INTERFACE_VERSION`. For full-text parser plugins, the symbol is `MYSQL_FTPARSER_INTERFACE_VERSION`. In the source code, you will find the actual interface version number for the full-text parser plugin defined in `include/mysql/plugin_ftparser.h`. With the introduction of full-text parser plugin support for `InnoDB`, the interface version number was incremented in MySQL 5.7 from `0x0100` to `0x0101`.

The `init` and `deinit` members should point to a function or be set to 0 if the function is not needed. The `parse` member must point to the function that performs the parsing.

In the `simple_parser` declaration, that descriptor is indicated by `&simple_parser_descriptor`. The descriptor specifies the version number for the full-text plugin interface (as given by `MYSQL_FTPARSER_INTERFACE_VERSION`), and the plugin's parsing, initialization, and deinitialization functions:

```
static struct st_mysql_ftparser simple_parser_descriptor=
```

```
{
    MYSQL_FTPARSER_INTERFACE_VERSION, /* interface version      */
    simple_parser_parse,              /* parsing function        */
    simple_parser_init,               /* parser init function    */
    simple_parser_deinit              /* parser deinit function */
};
```

A full-text parser plugin is used in two different contexts, indexing and searching. In both contexts, the server calls the initialization and deinitialization functions at the beginning and end of processing each SQL statement that causes the plugin to be invoked. However, during statement processing, the server calls the main parsing function in context-specific fashion:

- For indexing, the server calls the parser for each column value to be indexed.
- For searching, the server calls the parser to parse the search string. The parser might also be called for rows processed by the statement. In natural language mode, there is no need for the server to call the parser. For boolean mode phrase searches or natural language searches with query expansion, the parser is used to parse column values for information that is not in the index. Also, if a boolean mode search is done for a column that has no [FULLTEXT](#) index, the built-in parser will be called. (Plugins are associated with specific indexes. If there is no index, no plugin is used.)

The plugin declaration in the general plugin descriptor has [init](#) and [deinit](#) members that point initialization and deinitialization functions, and so does the type-specific plugin descriptor to which it points. However, these pairs of functions have different purposes and are invoked for different reasons:

- For the plugin declaration in the general plugin descriptor, the initialization and deinitialization functions are invoked when the plugin is loaded and unloaded.
- For the type-specific plugin descriptor, the initialization and deinitialization functions are invoked per SQL statement for which the plugin is used.

Each interface function named in the plugin descriptor should return zero for success or nonzero for failure, and each of them receives an argument that points to a [MYSQL\\_FTPARSER\\_PARAM](#) structure containing the parsing context. The structure has this definition:

```
typedef struct st_mysql_ftparser_param
{
    int (*mysql_parse)(struct st_mysql_ftparser_param *,
                      char *doc, int doc_len);
    int (*mysql_add_word)(struct st_mysql_ftparser_param *,
                        char *word, int word_len,
                        MYSQL_FTPARSER_BOOLEAN_INFO *boolean_info);
    void *ftparser_state;
    void *mysql_ftparam;
    struct charset_info_st *cs;
    char *doc;
    int length;
    int flags;
    enum enum_ftparser_mode mode;
} MYSQL_FTPARSER_PARAM;
```

The structure members are used as follows:

- [mysql\\_parse](#): A pointer to a callback function that invokes the server's built-in parser. Use this callback when the plugin acts as a front end to the built-in parser. That is, when the plugin parsing function is called, it should process the input to extract the text and pass the text to the [mysql\\_parse](#) callback.

The first parameter for this callback function should be the [param](#) value itself:

```
param->mysql_parse(param, ...);
```

A front end plugin can extract text and pass it all at once to the built-in parser, or it can extract and pass text to the built-in parser a piece at a time. However, in this case, the built-in parser treats the pieces of text as though there are implicit word breaks between them.

- `mysql_add_word`: A pointer to a callback function that adds a word to a full-text index or to the list of search terms. Use this callback when the parser plugin replaces the built-in parser. That is, when the plugin parsing function is called, it should parse the input into words and invoke the `mysql_add_word` callback for each word.

The first parameter for this callback function should be the `param` value itself:

```
param->mysql_add_word(param, ...);
```

- `ftparser_state`: This is a generic pointer. The plugin can set it to point to information to be used internally for its own purposes.
- `mysql_ftparam`: This is set by the server. It is passed as the first argument to the `mysql_parse` or `mysql_add_word` callback.
- `cs`: A pointer to information about the character set of the text, or 0 if no information is available.
- `doc`: A pointer to the text to be parsed.
- `length`: The length of the text to be parsed, in bytes.
- `flags`: Parser flags. This is zero if there are no special flags. The only nonzero flag is `MYSQL_FTFLAGS_NEED_COPY`, which means that `mysql_add_word()` must save a copy of the word (that is, it cannot use a pointer to the word because the word is in a buffer that will be overwritten.)

This flag might be set or reset by MySQL before calling the parser plugin, by the parser plugin itself, or by the `mysql_parse()` function.

- `mode`: The parsing mode. This value will be one of the following constants:
  - `MYSQL_FTPARSER_SIMPLE_MODE`: Parse in fast and simple mode, which is used for indexing and for natural language queries. The parser should pass to the server only those words that should be indexed. If the parser uses length limits or a stopword list to determine which words to ignore, it should not pass such words to the server.
  - `MYSQL_FTPARSER_WITH_STOPWORDS`: Parse in stopword mode. This is used in boolean searches for phrase matching. The parser should pass all words to the server, even stopwords or words that are outside any normal length limits.
  - `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`: Parse in boolean mode. This is used for parsing boolean query strings. The parser should recognize not only words but also boolean-mode operators and pass them to the server as tokens using the `mysql_add_word` callback. To tell the server what kind of token is being passed, the plugin needs to fill in a `MYSQL_FTPARSER_BOOLEAN_INFO` structure and pass a pointer to it.

#### Note

For `MyISAM`, the stopword list and `ft_min_word_len` and `ft_max_word_len` are checked inside the tokenizer. For `InnoDB`, the stopword list and equivalent word length variable settings (`innodb_ft_min_token_size` and `innodb_ft_max_token_size`) are checked outside of the tokenizer. As a result, `InnoDB` plugin parsers do not need to check the stopword list, `innodb_ft_min_token_size`,

or `innodb_ft_max_token_size`. Instead, it is recommended that all words be returned to `InnoDB`. However, if you want to check stopwords within your plugin parser, use `MYSQL_FTPARSER_SIMPLE_MODE`, which is for full-text search index and natural language search. For `MYSQL_FTPARSER_WITH_STOPWORDS` and `MYSQL_FTPARSER_FULL_BOOLEAN_INFO` modes, it is recommended that all words be returned to `InnoDB` including stopwords, in case of phrase searches.

If the parser is called in boolean mode, the `param->mode` value will be `MYSQL_FTPARSER_FULL_BOOLEAN_INFO`. The `MYSQL_FTPARSER_BOOLEAN_INFO` structure that the parser uses for passing token information to the server looks like this:

```
typedef struct st_mysql_ftparser_boolean_info
{
    enum enum_ft_token_type type;
    int yesno;
    int weight_adjust;
    char wasign;
    char trunc;
    int position;
    /* These are parser state and must be removed. */
    char prev;
    char *quot;
} MYSQL_FTPARSER_BOOLEAN_INFO;
```

The parser should fill in the structure members as follows:

- `type`: The token type. The following table shows the permissible types.

**Table 28.3 Full-Text Parser Token Types**

Token Value	Meaning
<code>FT_TOKEN_EOF</code>	End of data
<code>FT_TOKEN_WORD</code>	A regular word
<code>FT_TOKEN_LEFT_PAREN</code>	The beginning of a group or subexpression
<code>FT_TOKEN_RIGHT_PAREN</code>	The end of a group or subexpression
<code>FT_TOKEN_STOPWORD</code>	A stopwords

- `yesno`: Whether the word must be present for a match to occur. 0 means that the word is optional but increases the match relevance if it is present. Values larger than 0 mean that the word must be present. Values smaller than 0 mean that the word must not be present.
- `weight_adjust`: A weighting factor that determines how much a match for the word counts. It can be used to increase or decrease the word's importance in relevance calculations. A value of zero indicates no weight adjustment. Values greater than or less than zero mean higher or lower weight, respectively. The examples at [Section 12.9.2, "Boolean Full-Text Searches"](#), that use the `<` and `>` operators illustrate how weighting works.
- `wasign`: The sign of the weighting factor. A negative value acts like the `~` boolean-search operator, which causes the word's contribution to the relevance to be negative.
- `trunc`: Whether matching should be done as if the boolean-mode `*` truncation operator had been given.
- `position`: Start position of the word in the document, in bytes. Used by `InnoDB` full-text search. For existing plugins that are called in boolean mode, support must be added for the position member.

Plugins should not use the `prev` and `quot` members of the `MYSQL_FTPARSER_BOOLEAN_INFO` structure.

#### Note

The plugin parser framework does not support:

- The `@distance` boolean operator.
- A leading plus sign (+) or minus sign (-) boolean operator followed by a space and then a word ('+ apple' or '- apple'). The leading plus or minus sign must be directly adjacent to the word, for example: '+apple' or '-apple'.

For information about boolean full-text search operators, see [Section 12.9.2, “Boolean Full-Text Searches”](#).

#### 4. Set up the plugin interface functions.

The general plugin descriptor in the library descriptor names the initialization and deinitialization functions that the server should invoke when it loads and unloads the plugin. For `simple_parser`, these functions do nothing but return zero to indicate that they succeeded:

```
static int simple_parser_plugin_init(void *arg __attribute__((unused)))
{
    return(0);
}

static int simple_parser_plugin_deinit(void *arg __attribute__((unused)))
{
    return(0);
}
```

Because those functions do not actually do anything, you could omit them and specify 0 for each of them in the plugin declaration.

The type-specific plugin descriptor for `simple_parser` names the initialization, deinitialization, and parsing functions that the server invokes when the plugin is used. For `simple_parser`, the initialization and deinitialization functions do nothing:

```
static int simple_parser_init(MYSQL_FTPARSER_PARAM *param
                             __attribute__((unused)))
{
    return(0);
}

static int simple_parser_deinit(MYSQL_FTPARSER_PARAM *param
                                __attribute__((unused)))
{
    return(0);
}
```

Here too, because those functions do nothing, you could omit them and specify 0 for each of them in the plugin descriptor.

The main parsing function, `simple_parser_parse()`, acts as a replacement for the built-in full-text parser, so it needs to split text into words and pass each word to the server. The parsing function's first argument is a pointer to a structure that contains the parsing context. This structure has a `doc` member that points to the text to be parsed, and a `length` member that indicates how long the text is. The simple parsing done by the plugin considers nonempty runs of whitespace characters to be words, so it identifies words like this:

```
static int simple_parser_parse(MYSQL_FTPARSER_PARAM *param)
{
    char *end, *start, *docend= param->doc + param->length;

    for (end= start= param->doc;; end++)
    {
        if (end == docend)
        {
            if (end > start)
                add_word(param, start, end - start);
            break;
        }
        else if (isspace(*end))
        {
            if (end > start)
                add_word(param, start, end - start);
            start= end + 1;
        }
    }
    return(0);
}
```

As the parser finds each word, it invokes a function `add_word()` to pass the word to the server. `add_word()` is a helper function only; it is not part of the plugin interface. The parser passes the parsing context pointer to `add_word()`, as well as a pointer to the word and a length value:

```
static void add_word(MYSQL_FTPARSER_PARAM *param, char *word, size_t len)
{
    MYSQL_FTPARSER_BOOLEAN_INFO bool_info=
        { FT_TOKEN_WORD, 0, 0, 0, 0, 0, ' ', 0 };

    param->mysql_add_word(param, word, len, &bool_info);
}
```

#### Note

Prior to MySQL 5.7.3, the sixth `MYSQL_FTPARSER_BOOLEAN_INFO` member (just before the `' '` member) is not present.

For boolean-mode parsing, `add_word()` fills in the members of the `bool_info` structure as described earlier in the discussion of the `st_mysql_ftparser_boolean_info` structure.

5. Set up the status variables. For the `simple_parser` plugin, the following status variable array sets up one status variable with a value that is static text, and another with a value that is stored in a long integer variable:

```
long number_of_calls= 0;

struct st_mysql_show_var simple_status[]=
{
    {"simple_parser_static", (char *)"just a static text", SHOW_CHAR},
    {"simple_parser_called", (char *)&number_of_calls, SHOW_LONG},
    {0,0,0}
};
```

By using status variable names that begin with the plugin name, you can easily display the variables for a plugin with `SHOW STATUS`:

```
mysql> SHOW STATUS LIKE 'simple_parser%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| simple_parser_static | just a static text |
| simple_parser_called | 0 |
+-----+-----+
```

6. To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `simple_parser` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `mypluglib.so` (the `.so` suffix might differ depending on your platform).
7. To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN simple_parser SONAME 'mypluglib.so';
```

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

8. To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.5.2, “Obtaining Server Plugin Information”](#).
9. Test the plugin to verify that it works properly.

Create a table that contains a string column and associate the parser plugin with a `FULLTEXT` index on the column:

```
mysql> CREATE TABLE t (c VARCHAR(255),
->   FULLTEXT (c) WITH PARSER simple_parser
-> ) ENGINE=MyISAM;
Query OK, 0 rows affected (0.01 sec)
```

Insert some text into the table and try some searches. These should verify that the parser plugin treats all nonwhitespace characters as word characters:

```
mysql> INSERT INTO t VALUES
->   ('latin1_general_cs is a case-sensitive collation'),
->   ('I\'d like a case of oranges'),
->   ('this is sensitive information'),
->   ('another row'),
->   ('yet another row');
Query OK, 5 rows affected (0.02 sec)
Records: 5  Duplicates: 0  Warnings: 0
```

```
mysql> SELECT c FROM t;
+-----+
| c |
+-----+
| latin1_general_cs is a case-sensitive collation |
| I'd like a case of oranges |
| this is sensitive information |
| another row |
| yet another row |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('case') FROM t;
+-----+
| MATCH(c) AGAINST('case') |
+-----+
| 0 |
| 1.2968142032623 |
| 0 |
| 0 |
| 0 |
+-----+
5 rows in set (0.00 sec)
```

```
mysql> SELECT MATCH(c) AGAINST('sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('sensitive') |
+-----+
|                                |
|                                |
|                                |
|                                |
|                                |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('case-sensitive') FROM t;
+-----+
| MATCH(c) AGAINST('case-sensitive') |
+-----+
|                                |
|                                |
|                                |
|                                |
|                                |
+-----+
5 rows in set (0.01 sec)

mysql> SELECT MATCH(c) AGAINST('I\'d') FROM t;
+-----+
| MATCH(c) AGAINST('I\'d') |
+-----+
|                                |
|                                |
|                                |
|                                |
|                                |
+-----+
5 rows in set (0.01 sec)
```

Neither “case” nor “insensitive” match “case-insensitive” the way that they would for the built-in parser.

### 28.2.4.5 Writing Daemon Plugins

A daemon plugin is a simple type of plugin used for code that should be run by the server but that does not communicate with it. This section describes how to write a daemon server plugin, using the example plugin found in the `plugin/daemon_example` directory of MySQL source distributions. That directory contains the `daemon_example.cc` source file for a daemon plugin named `daemon_example` that writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory.

To write a daemon plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_DAEMON_PLUGIN` server plugin type and the data structures needed to declare the plugin.

The `daemon_example.cc` file sets up the library descriptor as follows. The library descriptor includes a single general server plugin descriptor.

```
mysql_declare_plugin(daemon_example)
{
    MYSQL_DAEMON_PLUGIN,
    &daemon_example_plugin,
    "daemon_example",
    "Brian Aker",
```

```

"Daemon example, creates a heartbeat beat file in mysql-heartbeat.log",
PLUGIN_LICENSE_GPL,
daemon_example_plugin_init, /* Plugin Init */
daemon_example_plugin_deinit, /* Plugin Deinit */
0x0100 /* 1.0 */,
NULL, /* status variables */
NULL, /* system variables */
NULL, /* config options */
0, /* flags */
}
mysql_declare_plugin_end;

```

The `name` member (`daemon_example`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The second member of the plugin descriptor, `daemon_example_plugin`, points to the type-specific daemon plugin descriptor. This structure consists only of the type-specific API version number:

```

struct st_mysql_daemon daemon_example_plugin=
{ MYSQL_DAEMON_INTERFACE_VERSION };

```

The type-specific structure has no interface functions. There is no communication between the server and the plugin, except that the server calls the initialization and deinitialization functions from the general plugin descriptor to start and stop the plugin:

- `daemon_example_plugin_init()` opens the heartbeat file and spawns a thread that wakes up periodically and writes the next message to the file.
- `daemon_example_plugin_deinit()` closes the file and performs other cleanup.

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `daemon_example` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `libdaemon_example.so` (the `.so` suffix might differ depending on your platform).

To use the plugin, register it with the server. For example, to register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN daemon_example SONAME 'libdaemon_example.so';
```

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.5.2, “Obtaining Server Plugin Information”](#).

While the plugin is loaded, it writes a heartbeat string at regular intervals to a file named `mysql-heartbeat.log` in the data directory. This file grows without limit, so after you have satisfied yourself that the plugin operates correctly, unload it:

```
UNINSTALL PLUGIN daemon_example;
```

## 28.2.4.6 Writing INFORMATION\_SCHEMA Plugins

This section describes how to write a server-side `INFORMATION_SCHEMA` table plugin. For example code that implements such plugins, see the `sql/sql_show.cc` file of a MySQL source distribution. You can also look at the example plugins found in the InnoDB source. See the `handler/i_s.cc` and `handler/ha_innodb.cc` files within the InnoDB source tree (in the `storage/innobase` directory).

To write an `INFORMATION_SCHEMA` table plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <sql_class.h>
#include <table.h>
```

These header files are located in the `sql` directory of MySQL source distributions. They contain C++ structures, so the source file for an `INFORMATION_SCHEMA` plugin must be compiled as C++ (not C) code.

The source file for the example plugin developed here is named `simple_i_s_table.cc`. It creates a simple `INFORMATION_SCHEMA` table named `SIMPLE_I_S_TABLE` that has two columns named `NAME` and `VALUE`. The general descriptor for a plugin library that implements the table looks like this:

```
mysql_declare_plugin(simple_i_s_library)
{
    MYSQL_INFORMATION_SCHEMA_PLUGIN,
    &simple_table_info,           /* type-specific descriptor */
    "SIMPLE_I_S_TABLE",         /* table name */
    "Author Name",              /* author */
    "Simple INFORMATION_SCHEMA table", /* description */
    PLUGIN_LICENSE_GPL,         /* license type */
    simple_table_init,          /* init function */
    NULL,
    0x0100,                     /* version = 1.0 */
    NULL,                       /* no status variables */
    NULL,                       /* no system variables */
    NULL,                       /* no reserved information */
    0                           /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`SIMPLE_I_S_TABLE`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `simple_table_info` member of the general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
static struct st_mysql_information_schema simple_table_info =
{ MYSQL_INFORMATION_SCHEMA_INTERFACE_VERSION };
```

The general descriptor points to the initialization and deinitialization functions:

- The initialization function provides information about the table structure and a function that populates the table.
- The deinitialization function performs any required cleanup. If no cleanup is needed, this descriptor member can be `NULL` (as in the example shown).

The initialization function should return 0 for success, 1 if an error occurs. The function receives a generic pointer, which it should interpret as a pointer to the table structure:

```
static int table_init(void *ptr)
{
    ST_SCHEMA_TABLE *schema_table= (ST_SCHEMA_TABLE*)ptr;

    schema_table->fields_info= simple_table_fields;
    schema_table->fill_table= simple_fill_table;
    return 0;
}
```

The function should set these two members of the table structure:

- `fields_info`: An array of `ST_FIELD_INFO` structures that contain information about each column.
- `fill_table`: A function that populates the table.

The array pointed to by `fields_info` should contain one element per column of the `INFORMATION_SCHEMA` plus a terminating element. The following `simple_table_fields` array for the example plugin indicates that `SIMPLE_I_S_TABLE` has two columns. `NAME` is string-valued with a length of 10 and `VALUE` is integer-valued with a display width of 20. The last structure marks the end of the array.

```
static ST_FIELD_INFO simple_table_fields[]=
{
    {"NAME", 10, MYSQL_TYPE_STRING, 0, 0 0, 0},
    {"VALUE", 6, MYSQL_TYPE_LONG, 0, MY_I_S_UNSIGNED, 0, 0},
    {0, 0, MYSQL_TYPE_NULL, 0, 0, 0, 0}
};
```

For more information about the column information structure, see the definition of `ST_FIELD_INFO` in the `table.h` header file. The permissible `MYSQL_TYPE_XXX` type values are those used in the C API; see [Section 27.8.5, “C API Data Structures”](#).

The `fill_table` member should be set to a function that populates the table and returns 0 for success, 1 if an error occurs. For the example plugin, the `simple_fill_table()` function looks like this:

```
static int simple_fill_table(THD *thd, TABLE_LIST *tables, Item *cond)
{
    TABLE *table= tables->table;

    table->field[0]->store("Name 1", 6, system_charset_info);
    table->field[1]->store(1);
    if (schema_table_store_record(thd, table))
        return 1;
    table->field[0]->store("Name 2", 6, system_charset_info);
    table->field[1]->store(2);
    if (schema_table_store_record(thd, table))
        return 1;
    return 0;
}
```

For each row of the `INFORMATION_SCHEMA` table, this function initializes each column, then calls `schema_table_store_record()` to install the row. The `store()` method arguments depend on the type of value to be stored. For column 0 (`NAME`, a string), `store()` takes a pointer to a string, its length, and information about the character set of the string:

```
store(const char *to, uint length, CHARSET_INFO *cs);
```

For column 1 (`VALUE`, an integer), `store()` takes the value and a flag indicating whether it is unsigned:

```
store(longlong nr, bool unsigned_value);
```

For other examples of how to populate `INFORMATION_SCHEMA` tables, search for instances of `schema_table_store_record()` in `sql_show.cc`.

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

To test the plugin, install it:

```
mysql> INSTALL PLUGIN SIMPLE_I_S_TABLE SONAME 'simple_i_s_table.so';
```

Verify that the table is present:

```
mysql> SELECT TABLE_NAME FROM INFORMATION_SCHEMA.TABLES
      -> WHERE TABLE_NAME = 'SIMPLE_I_S_TABLE';
+-----+
| TABLE_NAME |
+-----+
| SIMPLE_I_S_TABLE |
+-----+
```

Try to select from it:

```
mysql> SELECT * FROM INFORMATION_SCHEMA.SIMPLE_I_S_TABLE;
+-----+-----+
| NAME | VALUE |
+-----+-----+
| Name 1 | 1 |
| Name 2 | 2 |
+-----+-----+
```

Uninstall it:

```
mysql> UNINSTALL PLUGIN SIMPLE_I_S_TABLE;
```

### 28.2.4.7 Writing Semisynchronous Replication Plugins

This section describes how to write server-side semisynchronous replication plugins, using the example plugins found in the `plugin/semisync` directory of MySQL source distributions. That directory contains the source files for master and slave plugins named `rpl_semi_sync_master` and `rpl_semi_sync_slave`. The information here covers only how to set up the plugin framework. For details about how the plugins implement replication functions, see the source.

To write a semisynchronous replication plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin.h>
```

`plugin.h` defines the `MYSQL_REPLICATION_PLUGIN` server plugin type and the data structures needed to declare the plugin.

For the master side, `semisync_master_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_master`:

```
mysql_declare_plugin(semi_sync_master)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_master_plugin,
    "rpl_semi_sync_master",
    "He Zhenxing",
    "Semi-synchronous replication master",
    PLUGIN_LICENSE_GPL,
    semi_sync_master_plugin_init, /* Plugin Init */
    semi_sync_master_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_master_status_vars, /* status variables */
    semi_sync_master_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
```

```
}
mysql_declare_plugin_end;
```

For the slave side, `semisync_slave_plugin.cc` contains this general descriptor for a plugin named `rpl_semi_sync_slave`:

```
mysql_declare_plugin(semi_sync_slave)
{
    MYSQL_REPLICATION_PLUGIN,
    &semi_sync_slave_plugin,
    "rpl_semi_sync_slave",
    "He Zhenxing",
    "Semi-synchronous replication slave",
    PLUGIN_LICENSE_GPL,
    semi_sync_slave_plugin_init, /* Plugin Init */
    semi_sync_slave_plugin_deinit, /* Plugin Deinit */
    0x0100 /* 1.0 */,
    semi_sync_slave_status_vars, /* status variables */
    semi_sync_slave_system_vars, /* system variables */
    NULL, /* config options */
    0, /* flags */
}
mysql_declare_plugin_end;
```

For both the master and slave plugins, the general descriptor has pointers to the type-specific descriptor, the initialization and deinitialization functions, and to the status and system variables implemented by the plugin. For information about variable setup, see [Server Plugin Status and System Variables](#). The following remarks discuss the type-specific descriptor and the initialization and deinitialization functions for the master plugin but apply similarly to the slave plugin.

The `semi_sync_master_plugin` member of the master general descriptor points to the type-specific descriptor, which consists only of the type-specific API version number:

```
struct Mysql_replication semi_sync_master_plugin= {
    MYSQL_REPLICATION_INTERFACE_VERSION
};
```

The initialization and deinitialization function declarations look like this:

```
static int semi_sync_master_plugin_init(void *p);
static int semi_sync_master_plugin_deinit(void *p);
```

The initialization function uses the pointer to register transaction and binary logging “observers” with the server. After successful initialization, the server takes care of invoking the observers at the appropriate times. (For details on the observers, see the source files.) The deinitialization function cleans up by deregistering the observers. Each function returns 0 for success or 1 if an error occurs.

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `rpl_semi_sync_master` and `rpl_semi_sync_slave` plugins, they are compiled and installed when you build MySQL from source. They are also included in binary distributions. The build process produces shared object libraries with names of `semisync_master.so` and `semisync_slave.so` (the `.so` suffix might differ depending on your platform).

## 28.2.4.8 Writing Audit Plugins

This section describes how to write a server-side audit plugin, using the example plugin found in the `plugin/audit_null` directory of MySQL source distributions. The `audit_null.c` and `audit_null_variables.h` source files in that directory implement an audit plugin named `NULL_AUDIT`.

**Note**

Changes were made in MySQL 5.7.8 to reimplement query rewrite plugins as audit plugins, and then the audit plugin API itself was extensively revised in 5.7.9 (including the parts for query rewrite plugins). For these reasons, the discussion here describes the audit plugin API as of MySQL 5.7.9. The API prior to 5.7.8 is much like that for MySQL 5.6. To write audit plugins against the older API, see [Writing Audit Plugins](#) in [MySQL 5.6 Reference Manual](#).

**Note**

Other examples of plugins that use the audit plugin API are the query rewrite plugin (see [Section 5.5.4, “The Rewriter Query Rewrite Plugin”](#)) and the Version Tokens plugin (see [Section 5.5.5, “Version Tokens”](#)).

Within the server, the pluggable audit interface is implemented in the `sql_audit.h` and `sql_audit.cc` files in the `sql` directory of MySQL source distributions. Additionally, several places in the server call the audit interface when an auditable event occurs, so that registered audit plugins can be notified about the event if necessary. To see where such calls occur, search the server source files for invocations of functions with names of the form `mysql_audit_xxx()`. Audit notification occurs for server operations such as these:

- Client connect and disconnect events
- Writing a message to the general query log (if the log is enabled)
- Writing a message to the error log
- Sending a query result to a client

To write an audit plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_audit.h>
```

`plugin_audit.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_AUDIT_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_audit.h` defines data structures specific to audit plugins.

## Audit Plugin General Descriptor

An audit plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)) and a type-specific plugin descriptor. In `audit_null.c`, the general descriptor for `audit_null` looks like this:

```
mysql_declare_plugin(audit_null)
{
    MYSQL_AUDIT_PLUGIN,          /* type */
    &audit_null_descriptor,      /* descriptor */
    "NULL_AUDIT",               /* name */
    "Oracle Corp",              /* author */
    "Simple NULL Audit",        /* description */
    PLUGIN_LICENSE_GPL,
    audit_null_plugin_init,      /* init function (when loaded) */
    audit_null_plugin_deinit,    /* deinit function (when unloaded) */
    0x0003,                     /* version */
    simple_status,               /* status variables */
    system_variables,            /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The first member, `MYSQL_AUDIT_PLUGIN`, identifies this plugin as an audit plugin.

`audit_null_descriptor` points to the type-specific plugin descriptor, described later.

The `name` member (`NULL_AUDIT`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The `audit_null_plugin_init` initialization function performs plugin initialization when the plugin is loaded. The `audit_null_plugin_deinit` function performs cleanup when the plugin is unloaded.

The general plugin descriptor also refers to `simple_status` and `system_variables`, structures that expose several status and system variables. When the plugin is enabled, these variables can be inspected using `SHOW` statements (`SHOW STATUS`, `SHOW VARIABLES`) or the appropriate Performance Schema tables.

The `simple_status` structure declares several status variables with names of the form `Audit_null_XXX`. `NULL_AUDIT` increments the `Audit_null_called` status variable for every notification that it receives. The other status variables are more specific and `NULL_AUDIT` increments them only for notifications of specific events.

`system_variables` is an array of system variable elements, each of which is defined using a `MYSQL_THDVAR_XXX` macro. These system variables have names of the form `null_audit_XXX`. These variables can be used to communicate with the plugin at runtime.

## Audit Plugin Type-Specific Descriptor

The `audit_null_descriptor` value in the general plugin descriptor points to the type-specific plugin descriptor. For audit plugins, this descriptor has the following structure (defined in `plugin_audit.h`):

```
struct st_mysql_audit
{
    int interface_version;
    void (*release_thd)(MYSQL_THD);
    int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);
    unsigned long class_mask[MYSQL_AUDIT_CLASS_MASK_SIZE];
};
```

The type-specific descriptor for audit plugins has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For audit plugins, the value of the `interface_version` member is `MYSQL_AUDIT_INTERFACE_VERSION` (defined in `plugin_audit.h`).
- `release_thd`: A function that the server calls to inform the plugin that it is being dissociated from its thread context. This should be `NULL` if there is no such function.
- `event_notify`: A function that the server calls to notify the plugin that an auditable event has occurred. This function should not be `NULL`; that would not make sense because no auditing would occur.
- `class_mask`: An array of `MYSQL_AUDIT_CLASS_MASK_SIZE` elements. Each element specifies a bitmask for a given event class to indicate the subclasses for which the plugin wants notification. (This is how the plugin “subscribes” to events of interest.) An element should be 0 to ignore events for the corresponding event class.

The server uses the `event_notify` and `release_thd` functions together. They are called within the context of a specific thread, and a thread might perform an activity that produces several event notifications. The first time the server calls `event_notify` for a thread, it creates a binding of the

plugin to the thread. The plugin cannot be uninstalled while this binding exists. When no more events for the thread will occur, the server informs the plugin of this by calling the `release_thd` function, and then destroys the binding. For example, when a client issues a statement, the thread processing the statement might notify audit plugins about the result set produced by the statement and about the statement being logged. After these notifications occur, the server releases the plugin before putting the thread to sleep until the client issues another statement.

This design enables the plugin to allocate resources needed for a given thread in the first call to the `event_notify` function and release them in the `release_thd` function:

```
event_notify function:
    if memory is needed to service the thread
        allocate memory
    ... rest of notification processing ...

release_thd function:
    if memory was allocated
        release memory
    ... rest of release processing ...
```

That is more efficient than allocating and releasing memory repeatedly in the notification function.

For the `NULL_AUDIT` audit plugin, the type-specific plugin descriptor looks like this:

```
static struct st_mysql_audit audit_null_descriptor=
{
    MYSQL_AUDIT_INTERFACE_VERSION,          /* interface version */
    NULL,                                    /* release_thd function */
    audit_null_notify,                       /* notify function */
    { (unsigned long) MYSQL_AUDIT_GENERAL_ALL,
      (unsigned long) MYSQL_AUDIT_CONNECTION_ALL,
      (unsigned long) MYSQL_AUDIT_PARSE_ALL,
      (unsigned long) MYSQL_AUDIT_AUTHORIZATION_ALL,
      (unsigned long) MYSQL_AUDIT_TABLE_ACCESS_ALL,
      (unsigned long) MYSQL_AUDIT_GLOBAL_VARIABLE_ALL,
      (unsigned long) MYSQL_AUDIT_SERVER_STARTUP_ALL,
      (unsigned long) MYSQL_AUDIT_SERVER_SHUTDOWN_ALL,
      (unsigned long) MYSQL_AUDIT_COMMAND_ALL,
      (unsigned long) MYSQL_AUDIT_QUERY_ALL,
      (unsigned long) MYSQL_AUDIT_STORED_PROGRAM_ALL }
};
```

The server calls `audit_null_notify()` to pass audit event information to the plugin. There is no `release_thd` function.

The `class_mask` member is an array that indicates which event classes the plugin subscribes to. As shown, the array contents subscribe to all subclasses of all event classes that are available. To ignore all notifications for a given event class, specify the corresponding `class_mask` element as 0.

The number of `class_mask` elements corresponds to the number of event classes, each of which is listed in the `mysql_event_class_t` enumeration defined in `plugin_audit.h`:

```
typedef enum
{
    MYSQL_AUDIT_GENERAL_CLASS          = 0,
    MYSQL_AUDIT_CONNECTION_CLASS       = 1,
    MYSQL_AUDIT_PARSE_CLASS            = 2,
    MYSQL_AUDIT_AUTHORIZATION_CLASS     = 3,
    MYSQL_AUDIT_TABLE_ACCESS_CLASS     = 4,
    MYSQL_AUDIT_GLOBAL_VARIABLE_CLASS  = 5,
    MYSQL_AUDIT_SERVER_STARTUP_CLASS   = 6,
    MYSQL_AUDIT_SERVER_SHUTDOWN_CLASS  = 7,
    MYSQL_AUDIT_COMMAND_CLASS          = 8,
    MYSQL_AUDIT_QUERY_CLASS            = 9,
    MYSQL_AUDIT_STORED_PROGRAM_CLASS   = 10,
```

```

/* This item must be last in the list. */
MYSQL_AUDIT_CLASS_MASK_SIZE
} mysql_event_class_t;

```

For any given event class, `plugin_audit.h` defines bitmask symbols for individual event subclasses, as well as an `xxx_ALL` symbol that is the union of the all subclass bitmasks. For example, for `MYSQL_AUDIT_CONNECTION_CLASS` (the class that covers connect and disconnect events), `plugin_audit.h` defines these symbols:

```

typedef enum
{
    /** occurs after authentication phase is completed. */
    MYSQL_AUDIT_CONNECTION_CONNECT      = 1 << 0,
    /** occurs after connection is terminated. */
    MYSQL_AUDIT_CONNECTION_DISCONNECT   = 1 << 1,
    /** occurs after COM_CHANGE_USER RPC is completed. */
    MYSQL_AUDIT_CONNECTION_CHANGE_USER  = 1 << 2,
    /** occurs before authentication. */
    MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE = 1 << 3
} mysql_event_connection_subclass_t;

#define MYSQL_AUDIT_CONNECTION_ALL (MYSQL_AUDIT_CONNECTION_CONNECT | \
                                     MYSQL_AUDIT_CONNECTION_DISCONNECT | \
                                     MYSQL_AUDIT_CONNECTION_CHANGE_USER | \
                                     MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE)

```

To subscribe to all subclasses of the connection event class (as the `NULL_AUDIT` plugin does), a plugin specifies `MYSQL_AUDIT_CONNECTION_ALL` in the corresponding `class_mask` element (`class_mask[1]` in this case). To subscribe to only some subclasses, the plugin sets the `class_mask` element to the union of the subclasses of interest. For example, to subscribe only to the connect and change-user subclasses, the plugin sets `class_mask[1]` to this value:

```

MYSQL_AUDIT_CONNECTION_CONNECT | MYSQL_AUDIT_CONNECTION_CHANGE_USER

```

## Audit Plugin Notification Function

Most of the work for an audit plugin occurs in the notification function (the `event_notify` member of the type-specific plugin descriptor). The server calls this function for each auditable event. Audit plugin notification functions have this prototype:

```

int (*event_notify)(MYSQL_THD, mysql_event_class_t, const void *);

```

The second and third parameters of the `event_notify` function prototype represent the event class and a generic pointer to an event structure. (Events in different classes have different structures. The notification function can use the event class value to determine which event structure applies.) The function processes the event and returns a status indicating whether the server should continue processing the event or terminate it.

For `NULL_AUDIT`, the notification function is `audit_null_notify()`. This function increments a global event counter (which the plugin exposes as the value of the `Audit_null_called` status value), and then examines the event class to determine how to process the event structure:

```

static int audit_null_notify(MYSQL_THD thd __attribute__((unused)),
                             mysql_event_class_t event_class,
                             const void *event)
{
    ...

    number_of_calls++;

    if (event_class == MYSQL_AUDIT_GENERAL_CLASS)
    {
        const struct mysql_event_general *event_general=

```

```

                                (const struct mysql_event_general *)event;
    ...
}
else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
{
    const struct mysql_event_connection *event_connection=
                                (const struct mysql_event_connection *) event;
    ...
}
else if (event_class == MYSQL_AUDIT_PARSE_CLASS)
{
    const struct mysql_event_parse *event_parse =
                                (const struct mysql_event_parse *)event;
    ...
}
...
}

```

The notification function interprets the `event` argument according to the value of `event_class`. The `event` argument is a generic pointer to the event record, the structure of which differs per event class. (The `plugin_audit.h` file contains the structures that define the contents of each event class.) For each class, `audit_null_notify()` casts the event to the appropriate class-specific structure and then checks its subclass to determine which subclass counter to increment. For example, the code to handle events in the connection-event class looks like this:

```

else if (event_class == MYSQL_AUDIT_CONNECTION_CLASS)
{
    const struct mysql_event_connection *event_connection=
                                (const struct mysql_event_connection *) event;

    switch (event_connection->event_subclass)
    {
    case MYSQL_AUDIT_CONNECTION_CONNECT:
        number_of_calls_connection_connect++;
        break;
    case MYSQL_AUDIT_CONNECTION_DISCONNECT:
        number_of_calls_connection_disconnect++;
        break;
    case MYSQL_AUDIT_CONNECTION_CHANGE_USER:
        number_of_calls_connection_change_user++;
        break;
    case MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE:
        number_of_calls_connection_pre_authenticate++;
        break;
    default:
        break;
    }
}

```

### Note

The general event class (`MYSQL_AUDIT_GENERAL_CLASS`) is deprecated as of MySQL 5.7.9 and will be removed in a future MySQL release. To reduce plugin overhead, it is preferable to subscribe only to the more specific event classes of interest.

For some event classes, the `NULL_AUDIT` plugin performs other processing in addition to incrementing a counter. In any case, when the notification function finishes processing the event, it should return a status indicating whether the server should continue processing the event or terminate it.

## Audit Plugin Error Handling

Audit plugin notification functions can report a status value for the current event two ways:

- Use the notification function return value. In this case, the function returns zero if the server should continue processing the event, or nonzero if the server should terminate the event.

- Call the `my_message()` function to set the error state before returning from the notification function. In this case, the notification function return value is ignored and the server terminates event processing with an error. The `my_message()` arguments indicate which error to report, and its message. For example:

```
my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
```

Some events cannot be aborted. A nonzero return value is not taken into consideration and the `my_message()` error call must follow an `is_error()` check. For example:

```
if (!thd->get_stmt_da()->is_error())
{
    my_message(ER_AUDIT_API_ABORT, "This is my error message.", MYF(0));
}
```

Some events cannot be terminated:

- `MYSQL_AUDIT_CONNECTION_DISCONNECT`: The server cannot prevent a client from disconnecting.
- `MYSQL_AUDIT_COMMAND_END`: This event provides the status of a command that has finished executing, so there is no purpose to terminating it.

If an audit plugin returns nonzero status for a nonterminable event, the server ignores the status and continues processing the event. As of MySQL 5.7.9, that is also true if an audit plugin uses the `my_message()` function to terminate a nonterminable event.

## Audit Plugin Usage

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `NULL_AUDIT` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `adt_null.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN NULL_AUDIT SONAME 'adt_null.so';
```

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.5.2, “Obtaining Server Plugin Information”](#).

While the audit plugin is installed, it exposes status variables that indicate the events for which the plugin has been called:

```
mysql> SHOW STATUS LIKE 'Audit_null%';
```

Variable_name	Value
Audit_null_authorization_column	0
Audit_null_authorization_db	0
Audit_null_authorization_procedure	0
Audit_null_authorization_proxy	0
Audit_null_authorization_table	0
Audit_null_authorization_user	0
Audit_null_called	185547
Audit_null_command_end	20999
Audit_null_command_start	21001
Audit_null_connection_change_user	0

Audit_null_connection_connect	5823
Audit_null_connection_disconnect	5818
Audit_null_connection_pre_authenticate	5823
Audit_null_general_error	1
Audit_null_general_log	26559
Audit_null_general_result	19922
Audit_null_general_status	21000
Audit_null_global_variable_get	0
Audit_null_global_variable_set	0
Audit_null_parse_postparse	14648
Audit_null_parse_preparse	14648
Audit_null_query_nested_start	6
Audit_null_query_nested_status_end	6
Audit_null_query_start	14648
Audit_null_query_status_end	14647
Audit_null_server_shutdown	0
Audit_null_server_startup	1
Audit_null_table_access_delete	104
Audit_null_table_access_insert	2839
Audit_null_table_access_read	97842
Audit_null_table_access_update	278

`Audit_null_called` counts all events, and the other variables count instances of specific event subclasses. For example, the preceding `SHOW STATUS` statement causes the server to send a result to the client and to write a message to the general query log if that log is enabled. Thus, a client that issues the statement repeatedly causes `Audit_null_called`, `Audit_null_general_result`, and `Audit_null_general_log` to be incremented each time. (Before MySQL 5.7.5, notification of events for the general query log occur only if the general query log is enabled. As of 5.7.5, notifications occur whether or not that log is enabled.)

The status variables values are aggregated across all sessions. There are no counters for individual sessions.

`NULL_AUDIT` exposes several system variables that enable communication with the plugin at runtime:

```
mysql> SHOW VARIABLES LIKE 'null_audit%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| null_audit_abort_message |      |
| null_audit_abort_value   | 1     |
| null_audit_event_order_check |      |
| null_audit_event_order_check_exact | 1     |
| null_audit_event_order_started | 0     |
| null_audit_event_record   |      |
| null_audit_event_record_def |      |
+-----+-----+
```

To check the order of audit API calls, set the `null_audit_event_order_check` variable to the expected event order. For example:

```
SET null_audit_event_order_check =
  'MYSQL_AUDIT_CONNECTION_PRE_AUTHENTICATE;;; '
  'MYSQL_AUDIT_GENERAL_LOG;;; '
  'MYSQL_AUDIT_CONNECTION_CONNECT;;; ';
```

The statement takes advantage of the SQL syntax that concatenates adjacent strings into a single string.

The format of the value is:

```
'event_name;event_data;command' [';event_name;event_data;command'] ...
```

After the event order is matched, the `null_audit_event_order_check` value is replaced with a value of `EVENT-ORDER-OK`.

Specifying a command value of `ABORT_RET` makes it possible to abort the audit API call on the specified event. The following example aborts `INSERT` statement execution when its `MYSQL_AUDIT_QUERY_STATUS_END` event occurs:

```
SET null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_QUERY_START;;; '
'MYSQL_AUDIT_QUERY_STATUS_END;;ABORT_RET';
```

After the audit plugin matches the preceding sequence, it aborts event processing and sends an error message to the client:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_STATUS_END';1).
```

Returning a nonzero value from the audit API notification routine is the standard way to abort event execution. It is also possible to specify a custom error code by setting the `null_audit_abort_value` variable to the value that the notification routine should return:

```
SET null_audit_abort_value = 123;
```

Aborting a sequence results in a standard message with the custom error code. Suppose that you set audit log system variables like this:

```
SET null_audit_abort_value = 123;
SET null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then execution of `SELECT 1` results in this error:

```
ERROR 3164 (HY000): Aborted by Audit API ('MYSQL_AUDIT_QUERY_START';123).
```

An event can be also aborted with a custom message, specified by setting the `null_audit_abort_message` variable: Suppose that you set audit log system variables like this:

```
SET null_audit_abort_message = 'Custom error text.';
SET null_audit_event_order_check =
'MYSQL_AUDIT_COMMAND_START;command_id="3";;'
'MYSQL_AUDIT_GENERAL_LOG;;; '
'MYSQL_AUDIT_QUERY_START;;ABORT_RET';
```

Then aborting a sequence results in the following error:

```
ERROR 3164 (HY000): Custom error text.
```

For test-creation purposes, it is possible to record events that pass through the plugin. Recording starts by specifying start and end events in the `null_audit_event_record_def` variable:

```
SET null_audit_event_record_def =
'MYSQL_AUDIT_COMMAND_START;MYSQL_AUDIT_COMMAND_END';
```

Statement execution results in storing the events that occur in the `null_audit_event_record` variable.

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN NULL_AUDIT;
```

### 28.2.4.9 Writing Authentication Plugins

MySQL supports pluggable authentication, in which plugins are invoked to authenticate client connections. Authentication plugins enable the use of authentication methods other than the built-in method of passwords stored in the `mysql.user` table. For example, plugins can be written to access external authentication methods. Also, authentication plugins can support the proxy user capability, such that the connecting user is a proxy for another user and is treated, for purposes of access control, as having the privileges of a different user. For more information, see [Section 6.3.9, “Pluggable Authentication”](#), and [Section 6.3.10, “Proxy Users”](#).

An authentication plugin can be written for the server side or the client side. Server-side plugins use the same plugin API that is used for the other server plugin types such as full-text parser or audit plugins (although with a different type-specific descriptor). Client-side plugins use the client plugin API.

Several header files contain information relevant to authentication plugins:

- `plugin.h`: Defines the `MYSQL_AUTHENTICATION_PLUGIN` server plugin type.
- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see [Section 27.8.14, “C API Client Plugin Functions”](#)).
- `plugin_auth.h`: Defines the part of the server plugin API specific to authentication plugins. This includes the type-specific descriptor for server-side authentication plugins and the `MYSQL_SERVER_AUTH_INFO` structure.
- `plugin_auth_common.h`: Contains common elements of client and server authentication plugins. This includes return value definitions and the `MYSQL_PLUGIN_VIO` structure.

To write an authentication plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

- For a source file that implements a server authentication plugin, include this file:

```
#include <mysql/plugin_auth.h>
```

- For a source file that implements a client authentication plugin, or both client and server plugins, include these files:

```
#include <mysql/plugin_auth.h>
#include <mysql/client_plugin.h>
#include <mysql.h>
```

`plugin_auth.h` includes `plugin.h` and `plugin_auth_common.h`, so you need not include the latter files explicitly.

This section describes how to write a pair of simple server and client authentication plugins that work together.

#### Warning

These plugins accept any non-empty password and the password is sent in clear text. This is insecure, so the plugins *should not be used in production environments*.

The server-side and client-side plugins developed here both are named `auth_simple`. As described in [Section 28.2.4.2, “Plugin Data Structures”](#), the plugin library file must have the same base name

as the client plugin, so the source file name is `auth_simple.c` and produces a library named `auth_simple.so` (assuming that your system uses `.so` as the suffix for library files).

In MySQL source distributions, authentication plugin source is located in the `plugin/auth` directory and can be examined as a guide to writing other authentication plugins. Also, to see how the built-in authentication plugins are implemented, see `sql/sql_acl.cc` for plugins that are built in to the MySQL server and `sql-common/client.c` for plugins that are built in to the `libmysqlclient` client library. (For the built-in client plugins, note that the `auth_plugin_t` structures used there differ from the structures used with the usual client plugin declaration macros. In particular, the first two members are provided explicitly, not by declaration macros.)

## Writing the Server-Side Authentication Plugin

Declare the server-side plugin with the usual general descriptor format that is used for all server plugin types (see [Server Plugin Library and Plugin Descriptors](#)). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_plugin(auth_simple)
{
    MYSQL_AUTHENTICATION_PLUGIN,
    &auth_simple_handler,           /* type-specific descriptor */
    "auth_simple",                 /* plugin name */
    "Author Name",                 /* author */
    "Any-password authentication plugin", /* description */
    PLUGIN_LICENSE_GPL,           /* license type */
    NULL,                          /* no init function */
    NULL,                          /* no deinit function */
    0x0100,                        /* version = 1.0 */
    NULL,                          /* no status variables */
    NULL,                          /* no system variables */
    NULL,                          /* no reserved information */
    0                              /* no flags */
}
mysql_declare_plugin_end;
```

The `name` member (`auth_simple`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `SHOW PLUGINS` or `INFORMATION_SCHEMA.PLUGINS`.

The `auth_simple_handler` member of the general descriptor points to the type-specific descriptor. For an authentication plugin, the type-specific descriptor is an instance of the `st_mysql_auth` structure (defined in `plugin_auth.h`):

```
struct st_mysql_auth
{
    int interface_version;
    const char *client_auth_plugin;
    int (*authenticate_user)(MYSQL_PLUGIN_VIO *vio, MYSQL_SERVER_AUTH_INFO *info);
    int (*generate_authentication_string)(char *outbuf,
        unsigned int *outbuflen, const char *inbuf, unsigned int inbuflen);
    int (*validate_authentication_string)(char* const inbuf, unsigned int buflen);
    int (*set_salt)(const char *password, unsigned int password_len,
        unsigned char* salt, unsigned char *salt_len);
    const unsigned long authentication_flags;
};
```

The `st_mysql_auth` structure has these members:

- `interface_version`: The type-specific API version number, always `MYSQL_AUTHENTICATION_INTERFACE_VERSION`
- `client_auth_plugin`: The client plugin name
- `authenticate_user`: A pointer to the main plugin function that communicates with the client

- `generate_authentication_string`: A pointer to a plugin function that generates a password digest from an authentication string (added in MySQL 5.7.6)
- `validate_authentication_string`: A pointer to a plugin function that validates a password digest (added in MySQL 5.7.6)
- `set_salt`: A pointer to a plugin function that converts a scrambled password to binary form (added in MySQL 5.7.6)
- `authentication_flags`: A flags word (added in MySQL 5.7.8)

The `client_auth_plugin` member should indicate the name of the client plugin if a specific plugin is required. A value of `NULL` means “any plugin.” In the latter case, whatever plugin the client uses will do. This is useful if the server plugin does not care about the client plugin or what user name or password it sends. For example, this might be true if the server plugin authenticates only local clients and uses some property of the operating system rather than the information sent by the client plugin.

For `auth_simple`, the type-specific descriptor looks like this:

```
static struct st_mysql_auth auth_simple_handler =
{
    MYSQL_AUTHENTICATION_INTERFACE_VERSION,
    "auth_simple",           /* required client-side plugin name */
    auth_simple_server       /* server-side plugin main function */
    generate_auth_string_hash, /* generate digest from password string */
    validate_auth_string_hash, /* validate password digest */
    set_salt,               /* generate password salt value */
    AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE
};
```

The main function, `auth_simple_server()`, takes two arguments representing an I/O structure and a `MYSQL_SERVER_AUTH_INFO` structure. The structure definition, found in `plugin_auth.h`, looks like this:

```
typedef struct st_mysql_server_auth_info
{
    char *user_name;
    unsigned int user_name_length;
    const char *auth_string;
    unsigned long auth_string_length;
    char authenticated_as[MYSQL_USERNAME_LENGTH+1];
    char external_user[512];
    int password_used;
    const char *host_or_ip;
    unsigned int host_or_ip_length;
} MYSQL_SERVER_AUTH_INFO;
```

The character set for string members is UTF-8. If there is a `_length` member associated with a string, it indicates the string length in bytes. Strings are also null-terminated.

When an authentication plugin is invoked by the server, it should interpret the `MYSQL_SERVER_AUTH_INFO` structure members as follows. Some of these are used to set the value of SQL functions or system variables within the client session, as indicated.

- `user_name`: The user name sent by the client. The value becomes the `USER()` function value.
- `user_name_length`: The length of `user_name` in bytes.
- `auth_string`: The value of the `authentication_string` column of the `mysql.user` table row for the matching account name (that is, the row that matches the client user name and host name and that the server uses to determine how to authenticate the client).

Suppose that you create an account using the following statement:

```
CREATE USER 'my_user'@'localhost'
  IDENTIFIED WITH my_plugin AS 'my_auth_string';
```

When `my_user` connects from the local host, the server invokes `my_plugin` and passes `'my_auth_string'` to it as the `auth_string` value.

- `auth_string_length`: The length of `auth_string` in bytes.
- `authenticated_as`: The server sets this to the user name (the value of `user_name`). The plugin can alter it to indicate that the client should have the privileges of a different user. For example, if the plugin supports proxy users, the initial value is the name of the connecting (proxy) user, and the plugin can change this member to the proxied user name. The server then treats the proxy user as having the privileges of the proxied user (assuming that the other conditions for proxy user support are satisfied; see [Implementing Proxy User Support in Authentication Plugins](#)). The value is represented as a string at most `MYSQL_USER_NAME_LENGTH` bytes long, plus a terminating null. The value becomes the `CURRENT_USER()` function value.
- `external_user`: The server sets this to the empty string (null terminated). Its value becomes the `external_user` system variable value. If the plugin wants that system variable to have a different value, it should set this member accordingly; for example, to the connecting user name. The value is represented as a string at most 511 bytes long, plus a terminating null.
- `password_used`: This member applies when authentication fails. The plugin can set it or ignore it. The value is used to construct the failure error message of `Authentication fails. Password used: %s`. The value of `password_used` determines how `%s` is handled, as shown in the following table.

<code>password_used</code>	<code>%s</code> Handling
0	NO
1	YES
2	There will be no <code>%s</code>

- `host_or_ip`: The name of the client host if it can be resolved, or the IP address otherwise.
- `host_or_ip_length`: The length of `host_or_ip` in bytes.

The `auth_simple` main function, `auth_simple_server()`, reads the password (a null-terminated string) from the client and succeeds if the password is nonempty (first byte not null):

```
static int auth_simple_server (MYSQL_PLUGIN_VIO *vio,
                              MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;

    return CR_OK;
}
```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
<code>CR_OK</code>	Success
<code>CR_OK_HANDSHAKE_COMPLETE</code>	Do not send a status packet back to client
<code>CR_ERROR</code>	Error
<code>CR_AUTH_USER_CREDENTIALS</code>	Authentication failure
<code>CR_AUTH_HANDSHAKE</code>	Authentication handshake failure
<code>CR_AUTH_PLUGIN_ERROR</code>	Internal plugin error

For an example of how the handshake works, see the `plugin/auth/dialog.c` source file.

The server counts plugin errors in the Performance Schema `host_cache` table.

`auth_simple_server()` is so basic that it does not use the authentication information structure except to set the member that indicates whether a password was received.

A plugin that supports proxy users must return to the server the name of the proxied user (the MySQL user whose privileges the client user should get). To do this, the plugin must set the `info->authenticated_as` member to the proxied user name. For information about proxying, see [Section 6.3.10, “Proxy Users”](#), and [Implementing Proxy User Support in Authentication Plugins](#).

The `generate_authentication_string` member of the plugin descriptor takes the password and generates a password hash (digest) from it:

- The first two arguments are pointers to the output buffer and its maximum length in bytes. The function should write the password hash to the output buffer and reset the length to the actual hash length.
- The second two arguments indicate the password input buffer and its length in bytes.
- The function returns 0 for success, 1 if an error occurred.

For the `auth_simple` plugin, the `generate_auth_string_hash()` function implements the `generate_authentication_string` member. It just makes a copy of the password, unless it is too long to fit in the output buffer.

```
int generate_auth_string_hash(char *outbuf, unsigned int *buflen,
                             const char *inbuf, unsigned int inbuflen)
{
    /*
     * fail if buffer specified by server cannot be copied to output buffer
     */
    if (*buflen < inbuflen)
        return 1; /* error */
    strncpy(outbuf, inbuf, inbuflen);
    *buflen = strlen(inbuf);
    return 0; /* success */
}
```

The `validate_authentication_string` member of the plugin descriptor validates a password hash:

- The arguments are a pointer to the password hash and its length in bytes.
- The function returns 0 for success, 1 if the password hash cannot be validated.

For the `auth_simple` plugin, the `validate_auth_string_hash()` function implements the `validate_authentication_string` member. It returns success unconditionally:

```
int validate_auth_string_hash(char* const inbuf __attribute__((unused)),
                             unsigned int buflen __attribute__((unused)))
{
    return 0;    /* success */
}
```

The `set_salt` member of the plugin descriptor is used only by the `mysql_native_password` plugin (see [Section 6.5.1.1, “Native Pluggable Authentication”](#)). For other authentication plugins, you can use this trivial implementation:

```
int set_salt(const char* password __attribute__((unused)),
             unsigned int password_len __attribute__((unused)),
             unsigned char* salt __attribute__((unused)),
             unsigned char* salt_len)
{
    *salt_len= 0;
    return 0;    /* success */
}
```

The `authentication_flags` member of the plugin descriptor contains flags that affect plugin operation. The permitted flags are:

- `AUTH_FLAG_PRIVILEGED_USER_FOR_PASSWORD_CHANGE`: Credential changes are a privileged operation. If this flag is set, the server requires that the user has the global `CREATE USER` privilege or the `UPDATE` privilege for the `mysql` database.
- `AUTH_FLAG_USES_INTERNAL_STORAGE`: Whether the plugin uses internal storage (in the `authentication_string` column of `mysql.user` rows). If this flag is not set, attempts to set the password fail and the server produces a warning.

## Writing the Client-Side Authentication Plugin

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see [Client Plugin Descriptors](#)). For the `auth_simple` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(AUTHENTICATION)
    "auth_simple",           /* plugin name */
    "Author Name",          /* author */
    "Any-password authentication plugin", /* description */
    {1,0,0},                /* version = 1.0.0 */
    "GPL",                   /* license type */
    NULL,                    /* for internal use */
    NULL,                    /* no init function */
    NULL,                    /* no deinit function */
    NULL,                    /* no option-handling function */
    auth_simple_client       /* main function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. (For descriptions, see [Client Plugin Descriptors](#).) Following the common members, the descriptor has an additional member specific to authentication plugins. This is the “main” function, which handles communication with the server. The function takes two arguments representing an I/O structure and a connection handler. For our simple any-password plugin, the main function does nothing but write to the server the password provided by the user:

```
static int auth_simple_client (MYSQL_PLUGIN_VIO *vio, MYSQL *mysql)
{
    int res;

    /* send password as null-terminated string in clear text */
}
```

```

res= vio->write_packet(vio, (const unsigned char *) mysql->passwd,
                        strlen(mysql->passwd) + 1);

return res ? CR_ERROR : CR_OK;
}

```

The main function should return one of the error codes shown in the following table.

Error Code	Meaning
<code>CR_OK</code>	Success
<code>CR_OK_HANDSHAKE_COMPLETE</code>	Success, client done
<code>CR_ERROR</code>	Error

`CR_OK_HANDSHAKE_COMPLETE` indicates that the client has done its part successfully and has read the last packet. A client plugin may return `CR_OK_HANDSHAKE_COMPLETE` if the number of round trips in the authentication protocol is not known in advance and the plugin must read another packet to determine whether authentication is finished.

## Using the Authentication Plugins

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

Register the server-side plugin with the server. For example, to load the plugin at server startup, use a `--plugin-load=auth_simple.so` option (adjust the `.so` suffix for your platform as necessary).

Create a user for whom the server will use the `auth_simple` plugin for authentication:

```

mysql> CREATE USER 'x'@'localhost'
      -> IDENTIFIED WITH auth_simple;

```

Use a client program to connect to the server as user `x`. The server-side `auth_simple` plugin communicates with the client program that it should use the client-side `auth_simple` plugin, and the latter sends the password to the server. The server plugin should reject connections that send an empty password and accept connections that send a nonempty password. Invoke the client program each way to verify this:

```

shell> mysql --user=x --skip-password
ERROR 1045 (28000): Access denied for user 'x'@'localhost' (using password: NO)

shell> mysql --user=x --password
Enter password: abc
mysql>

```

Because the server plugin accepts any nonempty password, it should be considered insecure. After testing the plugin to verify that it works, restart the server without the `--plugin-load` option so as not to inadvertently leave the server running with an insecure authentication plugin loaded. Also, drop the user with `DROP USER 'x'@'localhost'`.

For additional information about loading and using authentication plugins, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#), and [Section 6.3.9, “Pluggable Authentication”](#).

If you are writing a client program that supports the use of authentication plugins, normally such a program causes a plugin to be loaded by calling `mysql_options()` to set the `MYSQL_DEFAULT_AUTH` and `MYSQL_PLUGIN_DIR` options:

```

char *plugin_dir = "path_to_plugin_dir";

```

```
char *default_auth = "plugin_name";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
mysql_options(&mysql, MYSQL_DEFAULT_AUTH, default_auth);
```

Typically, the program will also accept `--plugin-dir` and `--default-auth` options that enable users to override the default values.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 27.8.14, “C API Client Plugin Functions”](#).

## Implementing Proxy User Support in Authentication Plugins

One of the capabilities that pluggable authentication makes possible is proxy users (see [Section 6.3.10, “Proxy Users”](#)). For a server-side authentication plugin to participate in proxy user support, these conditions must be satisfied:

- When a connecting client should be treated as a proxy user, the plugin must return a different name in the `authenticated_as` member of the `MYSQL_SERVER_AUTH_INFO` structure, to indicate the proxied user name. It may also optionally set the `external_user` member, to set the value of the `external_user` system variable.
- Proxy user accounts must be set up to be authenticated by the plugin. Use the `CREATE USER` or `GRANT` statement to associate accounts with plugins.
- Proxy user accounts must have the `PROXY` privilege for the proxied accounts. Use the `GRANT` statement to grant this privilege.

In other words, the only aspect of proxy user support required of the plugin is that it set `authenticated_as` to the proxied user name. The rest is optional (setting `external_user`) or done by the DBA using SQL statements.

How does an authentication plugin determine which proxied user to return when the proxy user connects? That depends on the plugin. Typically, the plugin maps clients to proxied users based on the authentication string passed to it by the server. This string comes from the `AS` part of the `IDENTIFIED WITH` clause of the `CREATE USER` statement that specifies use of the plugin for authentication.

The plugin developer determines the syntax rules for the authentication string and implements the plugin according to those rules. Suppose that a plugin takes a comma-separated list of pairs that map external users to MySQL users. For example:

```
CREATE USER '@%.example.com'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqlusera, extuser2=mysqluserb'
CREATE USER '@%.example.org'
  IDENTIFIED WITH my_plugin AS 'extuser1=mysqluserc, extuser2=mysqluserd'
```

When the server invokes a plugin to authenticate a client, it passes the appropriate authentication string to the plugin. The plugin is responsible to:

1. Parse the string into its components to determine the mapping to use
2. Compare the client user name to the mapping
3. Return the proper MySQL user name

For example, if `extuser2` connects from an `example.com` host, the server passes `'extuser1=mysqlusera, extuser2=mysqluserb'` to the plugin, and the plugin should copy `mysqluserb` into `authenticated_as`, with a terminating null byte. If `extuser2` connects from an

`example.org` host, the server passes `'extuser1=mysqluserc, extuser2=mysqluserd'`, and the plugin should copy `mysqluserd` instead.

If there is no match in the mapping, the action depends on the plugin. If a match is required, the plugin likely will return an error. Or the plugin might simply return the client name; in this case, it should not change `authenticated_as`, and the server will not treat the client as a proxy.

The following example demonstrates how to handle proxy users using a plugin named `auth_simple_proxy`. Like the `auth_simple` plugin described earlier, `auth_simple_proxy` accepts any nonempty password as valid (and thus should not be used in production environments). In addition, it examines the `auth_string` authentication string member and uses these very simple rules for interpreting it:

- If the string is empty, the plugin returns the user name as given and no proxying occurs. That is, the plugin leaves the value of `authenticated_as` unchanged.
- If the string is nonempty, the plugin treats it as the name of the proxied user and copies it to `authenticated_as` so that proxying occurs.

For testing, set up one account that is not proxied according to the preceding rules, and one that is. This means that one account has no `AS` clause, and one includes an `AS` clause that names the proxied user:

```
CREATE USER 'plugin_user1'@'localhost'
  IDENTIFIED WITH auth_simple_proxy;
CREATE USER 'plugin_user2'@'localhost'
  IDENTIFIED WITH auth_simple_proxy AS 'proxied_user';
```

In addition, create an account for the proxied user and grant `plugin_user2` the `PROXY` privilege for it:

```
CREATE USER 'proxied_user'@'localhost'
  IDENTIFIED BY 'proxied_user_pass';
GRANT PROXY
  ON 'proxied_user'@'localhost'
  TO 'plugin_user2'@'localhost';
```

Before the server invokes an authentication plugin, it sets `authenticated_as` to the client user name. To indicate that the user is a proxy, the plugin should set `authenticated_as` to the proxied user name. For `auth_simple_proxy`, this means that it must examine the `auth_string` value, and, if the value is nonempty, copy it to the `authenticated_as` member to return it as the name of the proxied user. In addition, when proxying occurs, the plugin sets the `external_user` member to the client user name; this becomes the value of the `external_user` system variable.

```
static int auth_simple_proxy_server (MYSQL_PLUGIN_VIO *vio,
                                     MYSQL_SERVER_AUTH_INFO *info)
{
    unsigned char *pkt;
    int pkt_len;

    /* read the password as null-terminated string, fail on error */
    if ((pkt_len= vio->read_packet(vio, &pkt)) < 0)
        return CR_ERROR;

    /* fail on empty password */
    if (!pkt_len || *pkt == '\0')
    {
        info->password_used= PASSWORD_USED_NO;
        return CR_ERROR;
    }

    /* accept any nonempty password */
    info->password_used= PASSWORD_USED_YES;
```

```

/* if authentication string is nonempty, use as proxied user name */
/* and use client name as external_user value */
if (info->auth_string_length > 0)
{
    strcpy (info->authenticated_as, info->auth_string);
    strcpy (info->external_user, info->user_name);
}

return CR_OK;
}

```

After a successful connection, the `USER()` function should indicate the connecting client user and host name, and `CURRENT_USER()` should indicate the account whose privileges apply during the session. The latter value should be the connecting user account if no proxying occurs or the proxied account if proxying does occur.

Compile and install the plugin, then test it. First, connect as `plugin_user1`:

```

shell> mysql --user=plugin_user1 --password
Enter password: x

```

In this case, there should be no proxying:

```

mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
***** 1. row *****
      USER(): plugin_user1@localhost
    CURRENT_USER(): plugin_user1@localhost
      @@proxy_user: NULL
    @@external_user: NULL

```

Then connect as `plugin_user2`:

```

shell> mysql --user=plugin_user2 --password
Enter password: x

```

In this case, `plugin_user2` should be proxied to `proxied_user`:

```

mysql> SELECT USER(), CURRENT_USER(), @@proxy_user, @@external_user\G
***** 1. row *****
      USER(): plugin_user2@localhost
    CURRENT_USER(): proxied_user@localhost
      @@proxy_user: 'plugin_user2'@'localhost'
    @@external_user: 'plugin_user2'@'localhost'

```

#### 28.2.4.10 Writing Password-Validation Plugins

This section describes how to write a server-side password-validation plugin. The instructions are based on the source code in the `plugin/password_validation` directory of MySQL source distributions. The `validate_password.cc` source file in that directory implements the plugin named `validate_password`.

To write a password-validation plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_validate_password.h>
```

`plugin_validate_password.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_VALIDATE_PASSWORD_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_validate_password.h` defines data structures specific to password-validation plugins.

A password-validation plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)). In `validate_password.cc`, the general descriptor for `validate_password` looks like this:

```
mysql_declare_plugin(validate_password)
{
    MYSQL_VALIDATE_PASSWORD_PLUGIN, /* type */
    &validate_password_descriptor, /* descriptor */
    "validate_password", /* name */
    "Oracle Corporation", /* author */
    "check password strength", /* description */
    PLUGIN_LICENSE_GPL,
    validate_password_init, /* init function (when loaded) */
    validate_password_deinit, /* deinit function (when unloaded) */
    0x0100, /* version */
    NULL,
    validate_password_system_variables, /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The `name` member (`validate_password`) indicates the name to use for references to the plugin in statements such as `INSTALL PLUGIN` or `UNINSTALL PLUGIN`. This is also the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `validate_password_system_variables`, a structure that exposes several system variables to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var* validate_password_system_variables[] = {
    MYSQL_SYSVAR(length),
    MYSQL_SYSVAR(number_count),
    MYSQL_SYSVAR(mixed_case_count),
    MYSQL_SYSVAR(special_char_count),
    MYSQL_SYSVAR(policy),
    MYSQL_SYSVAR(dictionary_file),
    NULL
};
```

The `validate_password_init` initialization function reads the dictionary file if one was specified, and the `validate_password_deinit` function frees data structures associated with the file.

The `validate_password_descriptor` value in the general descriptor points to the type-specific descriptor. For password-validation plugins, this descriptor has the following structure:

```
struct st_mysql_validate_password
{
    int interface_version;
    /*
     * This function returns TRUE for passwords which satisfy the password
     * policy (as chosen by plugin variable) and FALSE for all other
     * password
     */
    int (*validate_password)(mysql_string_handle password);
    /*
     * This function returns the password strength (0-100) depending
     * upon the policies
     */
    int (*get_password_strength)(mysql_string_handle password);
};
```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin

to see whether the plugin is compatible with it. For password-validation plugins, the value of the `interface_version` member is `MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION` (defined in `plugin_validate_password.h`).

- `validate_password`: A function that the server calls to test whether a password satisfies the current password policy. It returns 1 if the password is okay and 0 otherwise. The argument is the password, passed as a `mysql_string_handle` value. This data type is implemented by the `mysql_string` server service. For details, see the `string_service.h` and `string_service.cc` source files in the `sql` directory.
- `get_password_strength`: A function that the server calls to assess the strength of a password. It returns a value from 0 (weak) to 100 (strong). The argument is the password, passed as a `mysql_string_handle` value.

For the `validate_password` plugin, the type-specific descriptor looks like this:

```
static struct st_mysql_validate_password validate_password_descriptor=
{
    MYSQL_VALIDATE_PASSWORD_INTERFACE_VERSION,
    validate_password,                /* validate function          */
    get_password_strength             /* validate strength function */
};
```

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `validate_password` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `validate_password.so` (the `.so` suffix might differ depending on your platform).

To register the plugin at runtime, use this statement (adjust the `.so` suffix for your platform as necessary):

```
INSTALL PLUGIN validate_password SONAME 'validate_password.so';
```

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement. See [Section 5.5.2, “Obtaining Server Plugin Information”](#).

While the `validate_password` plugin is installed, it exposes system variables that indicate the password-checking parameters:

```
mysql> SHOW VARIABLES LIKE 'validate_password%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| validate_password_dictionary_file |      |
| validate_password_length | 8 |
| validate_password_mixed_case_count | 1 |
| validate_password_number_count | 1 |
| validate_password_policy | MEDIUM |
| validate_password_special_char_count | 1 |
+-----+-----+
```

For descriptions of these variables, see [Section 6.5.3.2, “Password Validation Plugin Options and Variables”](#).

To disable the plugin after testing it, use this statement to unload it:

```
UNINSTALL PLUGIN validate_password;
```

### 28.2.4.11 Writing Protocol Trace Plugins

MySQL supports the use of protocol trace plugins: client-side plugins that implement tracing of communication between a client and the server that takes place using the client/server protocol. This capability can be used in MySQL 5.7.2 and up.

#### Using the Test Protocol Trace Plugin

MySQL includes a test protocol trace plugin that serves to illustrate the information available from such plugins, and as a guide to writing other protocol trace plugins. To see how the test plugin works, use a MySQL source distribution; binary distributions are built with the test plugin disabled.

Enable the test protocol trace plugin by configuring MySQL with the `WITH_TEST_TRACE_PLUGIN` `CMake` option enabled. This causes the test trace plugin to be built and MySQL client programs to load it, but the plugin has no effect by default. Control the plugin using these environment variables:

- `MYSQL_TEST_TRACE_DEBUG`: Set this variable to a value other than 0 to cause the test plugin to produce diagnostic output on `stderr`.
- `MYSQL_TEST_TRACE_CRASH`: Set this variable to a value other than 0 to cause the test plugin to abort the client program if it detects an invalid trace event.

#### Caution

Diagnostic output from the test protocol trace plugin can disclose passwords and other sensitive information.

Given a MySQL installation built from source with the test plugin enabled, you can see a trace of the communication between the `mysql` client and the MySQL server as follows:

```
shell> export MYSQL_TEST_TRACE_DEBUG=1
shll> mysql
test_trace: Test trace plugin initialized
test_trace: Starting tracing in stage CONNECTING
test_trace: stage: CONNECTING, event: CONNECTING
test_trace: stage: CONNECTING, event: CONNECTED
test_trace: stage: WAIT_FOR_INIT_PACKET, event: READ_PACKET
test_trace: stage: WAIT_FOR_INIT_PACKET, event: PACKET_RECEIVED
test_trace: packet received: 87 bytes
  0A 35 2E 37 2E 33 2D 6D 31 33 2D 64 65 62 75 67  .5.7.3-m13-debug
  2D 6C 6F 67 00 04 00 00 00 2B 7C 4F 55 3F 79 67  -log.....+|OU?yg
test_trace: 004: stage: WAIT_FOR_INIT_PACKET, event: INIT_PACKET_RECEIVED
test_trace: 004: stage: AUTHENTICATE, event: AUTH_PLUGIN
test_trace: 004: Using authentication plugin: mysql_native_password
test_trace: 004: stage: AUTHENTICATE, event: SEND_AUTH_RESPONSE
test_trace: 004: sending packet: 188 bytes
  85 A6 7F 00 00 00 00 01 21 00 00 00 00 00 00 00  .?.....!.....
  00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00  .....
...
mysql> quit
test_trace: 008: stage: READY_FOR_COMMAND, event: SEND_COMMAND
test_trace: 008: QUIT
test_trace: 008: stage: READY_FOR_COMMAND, event: PACKET_SENT
test_trace: 008: packet sent: 0 bytes
test_trace: 008: stage: READY_FOR_COMMAND, event: DISCONNECTED
test_trace: 008: Connection closed
test_trace: 008: Tracing connection has ended
Bye
test_trace: Test trace plugin de-initialized
```

To disable trace output, do this:

```
shell> MYSQL_TEST_TRACE_DEBUG=
```

## Using Your Own Protocol Trace Plugins

### Note

To use your own protocol trace plugins, you must configure MySQL with the `WITH_TEST_TRACE_PLUGIN` CMake option *disabled* because only one protocol trace plugin can be loaded at a time and an error occurs for attempts to load a second one. If you have already built MySQL with the test protocol trace plugin enabled to see how it works, you must rebuild MySQL without it before you can use your own plugins.

This section discusses how to write a basic protocol trace plugin named `simple_trace`. This plugin provides a framework showing how to set up the client plugin descriptor and create the trace-related callback functions. In `simple_trace`, these functions are rudimentary and do little other than illustrate the arguments required. To see in detail how a trace plugin can make use of trace event information, check the source file for the test protocol trace plugin (`test_trace_plugin.cc` in the `libmysql` directory of a MySQL source distribution). However, note that the `st_mysql_client_plugin_TRACE` structure used there differs from the structures used with the usual client plugin declaration macros. In particular, the first two members are defined explicitly, not implicitly by declaration macros.

Several header files contain information relevant to protocol trace plugins:

- `client_plugin.h`: Defines the API for client plugins. This includes the client plugin descriptor and function prototypes for client plugin C API calls (see [Section 27.8.14, “C API Client Plugin Functions”](#)).
- `plugin_trace.h`: Contains declarations for client-side plugins of type `MYSQL_CLIENT_TRACE_PLUGIN`. It also contains descriptions of the permitted protocol stages, transitions between stages, and the types of events permitted at each stage.

To write a protocol trace plugin, include the following header files in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_trace.h>
#include <mysql.h>
```

`plugin_trace.h` includes `client_plugin.h`, so you need not include the latter file explicitly.

Declare the client-side plugin descriptor with the `mysql_declare_client_plugin()` and `mysql_end_client_plugin` macros (see [Client Plugin Descriptors](#)). For the `simple_trace` plugin, the descriptor looks like this:

```
mysql_declare_client_plugin(TRACE)
    "simple_trace",           /* plugin name */
    "Author Name",          /* author */
    "Simple protocol trace plugin", /* description */
    {1,0,0},                /* version = 1.0.0 */
    "GPL",                  /* license type */
    NULL,                   /* for internal use */
    plugin_init,             /* initialization function */
    plugin_deinit,          /* deinitialization function */
    plugin_options,         /* option-handling function */
    trace_start,            /* start-trace function */
    trace_stop,             /* stop-trace function */
    trace_event             /* event-handling function */
mysql_end_client_plugin;
```

The descriptor members from the plugin name through the option-handling function are common to all client plugin types. The members following the common members implement trace event handling.

Function members for which the plugin needs no processing can be declared as `NULL` in the descriptor, in which case you need not write any corresponding function. For illustration purposes and to show the argument syntax, the following discussion implements all functions listed in the descriptor, even though some of them do nothing,

The initialization, deinitialization, and options functions common to all client plugins are declared as follows. For a description of the arguments and return values, see [Client Plugin Descriptors](#).

```
static int
plugin_init(char *errbuf, size_t errbuf_len, int argc, va_list args)
{
    return 0;
}

static int
plugin_deinit()
{
    return 0;
}

static int
plugin_options(const char *option, const void *value)
{
    return 0;
}
```

The trace-specific members of the client plugin descriptor are callback functions. The following descriptions provide more detail on how they are used. Each has a first argument that is a pointer to the plugin instance in case your implementation needs to access it.

`trace_start()`: This function is called at the start of each traced connection (each connection that starts after the plugin is loaded). It is passed the connection handler and the protocol stage at which tracing starts. `trace_start()` allocates memory needed by the `trace_event()` function, if any, and returns a pointer to it. If no memory is needed, this function returns `NULL`.

```
static void*
trace_start(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
            enum protocol_stage stage)
{
    struct st_trace_data *plugin_data= malloc(sizeof(struct st_trace_data));

    fprintf(stderr, "Initializing trace: stage %d\n", stage);
    if (plugin_data)
    {
        memset(plugin_data, 0, sizeof(struct st_trace_data));
        fprintf(stderr, "Trace initialized\n");
        return plugin_data;
    }
    fprintf(stderr, "Could not initialize trace\n");
    exit(1);
}
```

`trace_stop()`: This function is called when tracing of the connection ends. That usually happens when the connection is closed, but can happen earlier. For example, `trace_event()` can return a nonzero value at any time and that causes tracing of the connection to terminate. `trace_stop()` is then called even though the connection has not ended.

`trace_stop()` is passed the connection handler and a pointer to the memory allocated by `trace_start()` (`NULL` if none). If the pointer is non-`NULL`, `trace_stop()` should deallocate the memory. This function returns no value.

```
static void
trace_stop(struct st_mysql_client_plugin_TRACE *self,
            MYSQL *conn,
```

```

        void *plugin_data)
{
    fprintf(stderr, "Terminating trace\n");
    if (plugin_data)
        free(plugin_data);
}

```

`trace_event()`: This function is called for each event occurrence. It is passed a pointer to the memory allocated by `trace_start()` (`NULL` if none), the connection handler, the current protocol stage and event codes, and event data. This function returns 0 to continue tracing, nonzero if tracing should stop.

```

static int
trace_event(struct st_mysql_client_plugin_TRACE *self,
            void *plugin_data,
            MYSQL *conn,
            enum protocol_stage stage,
            enum trace_event event,
            struct st_trace_event_args args)
{
    fprintf(stderr, "Trace event received: stage %d, event %d\n", stage, event);
    if (event == TRACE_EVENT_DISCONNECTED)
        fprintf(stderr, "Connection closed\n");
    return 0;
}

```

The tracing framework shuts down tracing of the connection when the connection ends, so `trace_event()` should return nonzero only if you want to terminate tracing of the connection early. Suppose that you want to trace only connections for a certain MySQL account. After authentication, you can check the user name for the connection and stop tracing if it is not the user in whom you are interested.

For each call to `trace_event()`, the `st_trace_event_args` structure contains the event data. It has this definition:

```

struct st_trace_event_args
{
    const char      *plugin_name;
    int             cmd;
    const unsigned char *hdr;
    size_t          hdr_len;
    const unsigned char *pkt;
    size_t          pkt_len;
};

```

For different event types, the `st_trace_event_args` structure contains the information described following. All lengths are in bytes. Unused members are set to `0/NULL`.

**AUTH\_PLUGIN** event:

```

plugin_name  The name of the plugin

```

**SEND\_COMMAND** event:

```

cmd          The command code
hdr          Pointer to the command packet header
hdr_len      Length of the header
pkt          Pointer to the command arguments
pkt_len      Length of the arguments

```

Other **SEND\_XXX** and **XXX\_RECEIVED** events:

```

pkt          Pointer to the data sent or received

```

pkt_len	Length of the data
---------	--------------------

`PACKET_SENT` event:

pkt_len	Number of bytes sent
---------	----------------------

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable).

After the plugin library file is compiled and installed in the plugin directory, you can test it easily by setting the `LIBMYSQL_PLUGINS` environment variable to the plugin name, which affects any client program that uses that variable. `mysql` is one such program:

```
shell> export LIBMYSQL_PLUGINS=simple_trace
shqll> mysql
Initializing trace: stage 0
Trace initialized
Trace event received: stage 0, event 1
Trace event received: stage 0, event 2
...
Welcome to the MySQL monitor.  Commands end with ; or \g.
Trace event received
Trace event received
...
mysql> SELECT 1;
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
...
Trace event received: stage 8, event 14
Trace event received: stage 8, event 15
+----+
| 1 |
+----+
| 1 |
+----+
1 row in set (0.00 sec)

mysql> quit
Trace event received: stage 4, event 12
Trace event received: stage 4, event 16
Trace event received: stage 4, event 3
Connection closed
Terminating trace
Bye
```

To stop the trace plugin from being loaded, do this:

```
shell> LIBMYSQL_PLUGINS=
```

It is also possible to write client programs that directly load the plugin. You can tell the client where the plugin directory is located by calling `mysql_options()` to set the `MYSQL_PLUGIN_DIR` option:

```
char *plugin_dir = "path_to_plugin_dir";

/* ... process command-line options ... */

mysql_options(&mysql, MYSQL_PLUGIN_DIR, plugin_dir);
```

Typically, the program will also accept a `--plugin-dir` option that enables users to override the default value.

Should a client program require lower-level plugin management, the client library contains functions that take an `st_mysql_client_plugin` argument. See [Section 27.8.14, “C API Client Plugin Functions”](#).

### 28.2.4.12 Writing Keyring Plugins

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to write a server-side keyring plugin that can be used by service functions to perform key-management operations. For general keyring information, see [Section 6.5.4, “The MySQL Keyring”](#).

The instructions here are based on the source code in the `plugin/keyring` directory of MySQL source distributions. The source files in that directory implement a plugin named `keyring_file` that uses a file local to the server host for data storage.

To write a keyring plugin, include the following header file in the plugin source file. Other MySQL or general header files might also be needed, depending on the plugin capabilities and requirements.

```
#include <mysql/plugin_keyring.h>
```

`plugin_keyring.h` includes `plugin.h`, so you need not include the latter file explicitly. `plugin.h` defines the `MYSQL_KEYRING_PLUGIN` server plugin type and the data structures needed to declare the plugin. `plugin_keyring.h` defines data structures specific to keyring plugins.

A keyring plugin, like any MySQL server plugin, has a general plugin descriptor (see [Server Plugin Library and Plugin Descriptors](#)). In `keyring.cc`, the general descriptor for `keyring_file` looks like this:

```
mysql_declare_plugin(keyring_file)
{
    MYSQL_KEYRING_PLUGIN,          /* type */
    &keyring_descriptor,           /* descriptor */
    "keyring_file",                /* name */
    "Oracle Corporation",          /* author */
    "store/fetch authentication data to/from a flat file", /* description */
    PLUGIN_LICENSE_GPL,
    keyring_init,                  /* init function (when loaded) */
    keyring_deinit,                /* deinit function (when unloaded) */
    0x0100,                        /* version */
    NULL,                          /* status variables */
    keyring_system_variables,      /* system variables */
    NULL,
    0,
}
mysql_declare_plugin_end;
```

The `name` member (`keyring_file`) indicates the plugin name. This is the name displayed by `INFORMATION_SCHEMA.PLUGINS` or `SHOW PLUGINS`.

The general descriptor also refers to `keyring_system_variables`, a structure that exposes a system variable to the `SHOW VARIABLES` statement:

```
static struct st_mysql_sys_var *keyring_system_variables[] = {
    MYSQL_SYSVAR(data),
    NULL
};
```

The `keyring_init` initialization function creates the data file if it does not exist, then reads it and initializes the keystore. The `keyring_deinit` function frees data structures associated with the file.

The `keyring_descriptor` value in the general descriptor points to the type-specific descriptor. For keyring plugins, this descriptor has the following structure:

```
struct st_mysql_keyring
{
    int interface_version;
```

```

my_bool (*mysql_key_store)(const char *key_id, const char *key_type,
                           const char* user_id, const void *key, size_t key_len);
my_bool (*mysql_key_fetch)(const char *key_id, char **key_type,
                           const char *user_id, void **key, size_t *key_len);
my_bool (*mysql_key_remove)(const char *key_id, const char *user_id);
my_bool (*mysql_key_generate)(const char *key_id, const char *key_type,
                              const char *user_id, size_t key_len);
};

```

The type-specific descriptor has these members:

- `interface_version`: By convention, type-specific plugin descriptors begin with the interface version for the given plugin type. The server checks `interface_version` when it loads the plugin to see whether the plugin is compatible with it. For keyring plugins, the value of the `interface_version` member is `MYSQL_KEYRING_INTERFACE_VERSION` (defined in `plugin_keyring.h`).
- `mysql_key_store`: A function that obfuscates and stores a key in the keyring.
- `mysql_key_fetch`: A function that deobfuscates and retrieves a key from the keyring.
- `mysql_key_remove`: A function that removes a key from the keyring.
- `mysql_key_generate`: A function that generates a new random key and stores it in the keyring.

For the `keyring_file` plugin, the type-specific descriptor looks like this:

```

static struct st_mysql_keyring keyring_descriptor=
{
    MYSQL_KEYRING_INTERFACE_VERSION,
    mysql_key_store,
    mysql_key_fetch,
    mysql_key_remove,
    mysql_key_generate
};

```

The `mysql_key_xxx` functions implemented by a keyring plugin are analogous to the `my_key_xxx` functions exposed by the keyring service API. For example, the `mysql_key_store` plugin function is analogous to the `my_key_store` keyring service function. For information about the arguments to keyring service functions and how they are used, see [Section 28.3.2, “The Keyring Service”](#).

To compile and install a plugin library file, use the instructions in [Section 28.2.4.3, “Compiling and Installing Plugin Libraries”](#). To make the library file available for use, install it in the plugin directory (the directory named by the `plugin_dir` system variable). For the `keyring_file` plugin, it is compiled and installed when you build MySQL from source. It is also included in binary distributions. The build process produces a shared object library with a name of `keyring_file.so` (the `.so` suffix might differ depending on your platform).

Keyring plugins typically are loaded early during the server startup process so that they are available to built-in plugins and storage engines that might depend on them. For `keyring_file`, use these lines in the server `my.cnf` file (adjust the `.so` suffix for your platform as necessary):

```

[mysqld]
early-plugin-load=keyring_file.so

```

For additional information about plugin loading, see [Section 5.5.1, “Installing and Uninstalling Plugins”](#).

To verify plugin installation, examine the `INFORMATION_SCHEMA.PLUGINS` table or use the `SHOW PLUGINS` statement (see [Section 5.5.2, “Obtaining Server Plugin Information”](#)). For example:

```

mysql> SELECT PLUGIN_NAME, PLUGIN_STATUS
      FROM INFORMATION_SCHEMA.PLUGINS

```

```
WHERE PLUGIN_NAME LIKE 'keyring%';
```

PLUGIN_NAME	PLUGIN_STATUS
keyring_file	ACTIVE

While the `keyring_file` plugin is installed, it exposes a system variable that indicates the location of the data file it uses for secure information storage:

```
mysql> SHOW VARIABLES LIKE 'keyring_file%';
```

Variable_name	Value
keyring_file_data	/usr/local/mysql/keyring/keyring

For a description of the `keyring_file_data` variable, see [Section 5.1.7, “Server System Variables”](#).

To disable the plugin after testing it, restart the server without an `--early-plugin-load` option that names the plugin.

## 28.3 MySQL Services for Plugins

MySQL server plugins have access to server “plugin services.” The plugin services interface exposes server functionality that plugins can call. It complements the plugin API and has these characteristics:

- Services enable plugins to access code inside the server using ordinary function calls. Services are also available to user-defined functions (UDFs).
- Services are portable and work on multiple platforms.
- The interface includes a versioning mechanism so that service versions supported by the server can be checked at load time against plugin versions. Versioning protects against incompatibilities between the version of a service that the server provides and the version of the service expected or required by a plugin.
- For information about plugins for testing plugin services, see [Plugins for Testing Plugin Services](#).

The plugin services interface differs from the plugin API as follows:

- The plugin API enables plugins to be used by the server. The calling initiative lies with the server to invoke plugins. This enables plugins to extend server functionality or register to receive notifications about server processing.
- The plugin services interface enables plugins to call code inside the server. The calling initiative lies with plugins to invoke service functions. This enables functionality already implemented in the server to be used by many plugins; they need not individually implement it themselves.

To determine what services exist and what functions they provide, look in the `include/mysql` directory of a MySQL source distribution. The relevant files are:

- `plugin.h` includes `services.h`, which is the “umbrella” header that includes all available service-specific header files.
- Service-specific headers have names of the form `service_xxx.h`.

Each service-specific header should contain comments that provide full usage documentation for a given service, including what service functions are available, their calling sequences, and return values.

For developers who wish to modify the server to add a new service, see [MySQL Internals: MySQL Services for Plugins](#).

Available services include the following:

- `locking_service`: A service that implements locks with three attributes: Lock namespace, lock name, and lock mode. This locking interface is available at two levels: 1) As a C language interface, callable as a plugin service from server plugins or user-defined functions; 2) At the SQL level, as a set of user-defined functions that map onto calls to the service routines. For more information, see [Section 28.3.1, “The Locking Service”](#).
- `my_plugin_log_service`: A service that enables plugins to report errors and specify error messages. The server writes the messages to its error log.
- `my_snprintf`: A string-formatting service that produces consistent results across platforms.
- `my_thd_scheduler`: A service for plugins to select a thread scheduler.
- `mysql_keyring`: A service for keyring storage. For more information, see [Section 28.3.2, “The Keyring Service”](#).
- `mysql_password_policy`: A service for password validation and strength checking.
- `mysql_string`: A service for string manipulation.
- `security_context`: A service that enables plugins to examine or manipulate thread security contexts. This service provides setter and getter routines to access attributes of the server `Security_context` class, which includes attributes such as login user and host, authenticated user and host, and client IP address.
- `thd_alloc`: A memory-allocation service.
- `thd_wait`: A service for plugins to report when they are going to sleep or stall.

The remainder of this section describes how a plugin uses server functionality that is available as a service. See also the source for the “daemon” example plugin, which uses the `my_snprintf` service. Within a MySQL source distribution, that plugin is located in the `plugin/daemon_example` directory.

To use a service or services from within a plugin, the plugin source file must include the `plugin.h` header file to access service-related information:

```
#include <mysql/plugin.h>
```

This does not represent any additional setup cost. A plugin must include that file anyway because it contains definitions and structures that every plugin needs.

To access a service, a plugin calls service functions like any other function. For example, to format a string into a buffer for printing, call the `my_snprintf()` function provided by the service of the same name:

```
char buffer[BUFFER_SIZE];  
  
my_snprintf(buffer, sizeof(buffer), format_string, argument_to_format, ...);
```

To report an error that the server will write to its error log, first choose an error level. `mysql/service_my_plugin_log.h` defines these levels:

```
enum plugin_log_level  
{  
    MY_ERROR_LEVEL,  
    MY_WARNING_LEVEL,  
    MY_INFORMATION_LEVEL  
};
```

Then invoke `my_plugin_log_message()`:

```
int my_plugin_log_message(MYSQL_PLUGIN *plugin, enum plugin_log_level level,
                        const char *format, ...);
```

For example:

```
my_plugin_log_message(plugin_ptr, MY_ERROR_LEVEL, "Cannot initialize plugin");
```

Some services *for* plugins may be provided *by* plugins and thus are available only if the service-providing plugin is loaded. Any MySQL component that uses such a service should check whether the service is available.

When you build your plugin, use the `-lmysqlservices` flag at link time to link in the `libmysqlservices` library. For example, for CMake, put this in the top-level `CMakeLists.txt` file:

```
FIND_LIBRARY(MYSQLSERVICES_LIB mysqlservices
PATHS "${MYSQL_SRCDIR}/libservices" NO_DEFAULT_PATH)
```

Put this in the `CMakeLists.txt` file in the directory containing the plugin source:

```
# the plugin needs the mysql services library for error logging
TARGET_LINK_LIBRARIES (your_plugin_library_name ${MYSQLSERVICES_LIB})
```

## 28.3.1 The Locking Service

Distributions of MySQL 5.7.8 or higher provide a locking interface that is available at two levels:

- As a C language interface, callable as a plugin service from server plugins or user-defined functions
- At the SQL level, as a set of user-defined functions that map onto calls to the service routines

For general information about plugin services, see [Section 28.3, “MySQL Services for Plugins”](#). For general information about user-defined functions, see [Section 28.4.2, “Adding a New User-Defined Function”](#).

The locking interface has these characteristics:

- Locks have three attributes: Lock namespace, lock name, and lock mode:
  - Locks are identified by the combination of namespace and lock name. The namespace enables different applications to use the same lock names without colliding by creating locks in separate namespaces. For example, if applications A and B use namespaces of `ns1` and `ns2`, respectively, each application can use lock names `lock1` and `lock2` without interfering with the other application.
  - A lock mode is either read or write. Read locks are shared: If a session has a read lock on a given lock identifier, other sessions can acquire a read lock on the same identifier. Write locks are exclusive: If a session has a write lock on a given lock identifier, other sessions cannot acquire a read or write lock on the same identifier.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters. A namespace or lock name specified as `NULL`, the empty string, or a string longer than 64 characters results in an `ER_LOCKING_SERVICE_WRONG_NAME` error.
- The locking interface treats namespace and lock names as binary strings, so comparisons are case-sensitive.
- The locking interface provides functions to acquire locks and release locks. No special privilege is required to call these functions. Privilege checking is the responsibility of the calling application.

- Locks can be waited for if not immediately available. Lock acquisition calls take an integer timeout value that indicates how many seconds to wait to acquire locks before giving up. If the timeout is reached without successful lock acquisition, an `ER_LOCKING_SERVICE_TIMEOUT` error occurs. If the timeout is 0, there is no waiting and the call produces an error if locks cannot be acquired immediately.
- The locking interface detects deadlock between lock-acquisition calls in different sessions. In this case, the locking service chooses a caller and terminates its lock-acquisition request with an `ER_LOCKING_SERVICE_DEADLOCK` error. This error does not cause transactions to roll back. To choose a session in case of deadlock, the locking service prefers sessions that hold read locks over sessions that hold write locks.
- A session can acquire multiple locks with a single lock-acquisition call. For a given call, lock acquisition is atomic: The call succeeds if all locks are acquired. If acquisition of any lock fails, the call acquires no locks and fails, typically with an `ER_LOCKING_SERVICE_TIMEOUT` or `ER_LOCKING_SERVICE_DEADLOCK` error.
- A session can acquire multiple locks for the same lock identifier (namespace and lock name combination). These lock instances can be read locks, write locks, or a mix of both.
- Locks acquired within a session are released explicitly by calling a release-locks function, or implicitly when the session terminates (either normally or abnormally). Locks are not released when transactions commit or roll back.
- Within a session, all locks for a given namespace when released are released together.

The interface provided by the locking service is distinct from that provided by `GET_LOCK()` and related SQL functions (see [Section 12.20, “Miscellaneous Functions”](#)). For example, `GET_LOCK()` does not implement namespaces and provides only exclusive locks, not distinct read and write locks.

### 28.3.1.1 The Locking Service C Interface

This section describes how to use the locking service C language interface. To use the UDF interface instead, see [Section 28.3.1.2, “The Locking Service UDF Interface”](#). For general characteristics of the locking service interface, see [Section 28.3.1, “The Locking Service”](#). For general information about plugin services, see [Section 28.3, “MySQL Services for Plugins”](#).

Source files that use the locking service should include this header file:

```
#include <mysql/service_locking.h>
```

To acquire one or more locks, call this function:

```
int mysql_acquire_locking_service_locks(MYSQL_THD opaque_thd,
                                       const char* lock_namespace,
                                       const char**lock_names,
                                       size_t lock_num,
                                       enum enum_locking_service_lock_type lock_type,
                                       unsigned long lock_timeout);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.
- `lock_names`: An array of null-terminated strings that provides the names of the locks to acquire.
- `lock_num`: The number of names in the `lock_names` array.
- `lock_type`: The lock mode, either `LOCKING_SERVICE_READ` or `LOCKING_SERVICE_WRITE` to acquire read locks or write locks, respectively.

- `lock_timeout`: An integer number of seconds to wait to acquire the locks before giving up.

To release locks acquired for a given namespace, call this function:

```
int mysql_release_locking_service_locks(MYSQL_THD opaque_thd,  
                                         const char* lock_namespace);
```

The arguments have these meanings:

- `opaque_thd`: A thread handle. If specified as `NULL`, the handle for the current thread is used.
- `lock_namespace`: A null-terminated string that indicates the lock namespace.

Locks acquired or waited for by the locking service can be monitored at the SQL level using the Performance Schema. For details, see [Locking Service Monitoring](#).

### 28.3.1.2 The Locking Service UDF Interface

This section describes how to use the locking service user-defined function (UDF) interface. To use the C language interface instead, see [Section 28.3.1.1, “The Locking Service C Interface”](#). For general characteristics of the locking service interface, see [Section 28.3.1, “The Locking Service”](#). For general information about user-defined functions, see [Section 28.4.2, “Adding a New User-Defined Function”](#).

#### Installing or Uninstalling the UDF Locking Interface

The locking service routines described in [Section 28.3.1.1, “The Locking Service C Interface”](#) need not be installed because they are built into the server. The same is not true of the user-defined functions (UDFs) that map onto calls to the service routines: The UDFs must be installed before use. This section describes how to do that. For general information about UDF installation, see [Section 28.4.2.5, “UDF Compiling and Installing”](#).

The locking service UDFs are implemented in a plugin library file located in the directory named by the `plugin_dir` system variable. The file base name is `locking_service`. The file name suffix differs per platform (for example, `.so` for Unix and Unix-like systems, `.dll` for Windows).

To install the locking service UDFs, use the `CREATE FUNCTION` statement (adjust the `.so` suffix for your platform as necessary):

```
CREATE FUNCTION service_get_read_locks RETURNS INT SONAME 'locking_service.so';  
CREATE FUNCTION service_get_write_locks RETURNS INT SONAME 'locking_service.so';  
CREATE FUNCTION service_release_locks RETURNS INT SONAME 'locking_service.so';
```

If the UDFs are used on a master replication server, install them on all slave servers as well to avoid replication problems.

Once installed, the UDFs remain installed until uninstalled. To remove them, use the `DROP FUNCTION` statement:

```
DROP FUNCTION service_get_read_locks;  
DROP FUNCTION service_get_write_locks;  
DROP FUNCTION service_release_locks;
```

#### Using the UDF Locking Interface

Before using the locking service UDFs, install them according to the instructions provided at [Installing or Uninstalling the UDF Locking Interface](#).

To acquire one or more read locks, call this function:

```
mysql> SELECT service_get_read_locks('mysamespace', 'rlock1', 'rlock2', 10);
+-----+
| service_get_read_locks('mysamespace', 'rlock1', 'rlock2', 10) |
+-----+
| 1 |
+-----+
```

The first argument is the lock namespace. The final argument is an integer timeout indicating how many seconds to wait to acquire the locks before giving up. The arguments in between are the lock names.

For the example just shown, the function acquires locks with lock identifiers (`mysamespace, rlock1`) and (`mysamespace, rlock2`).

To acquire write locks rather than read locks, call this function:

```
mysql> SELECT service_get_write_locks('mysamespace', 'wlock1', 'wlock2', 10);
+-----+
| service_get_write_locks('mysamespace', 'wlock1', 'wlock2', 10) |
+-----+
| 1 |
+-----+
```

In this case, the lock identifiers are (`mysamespace, wlock1`) and (`mysamespace, wlock2`).

To release all locks for a namespace, use this function:

```
mysql> SELECT service_release_locks('mysamespace');
+-----+
| service_release_locks('mysamespace') |
+-----+
| 1 |
+-----+
```

Each locking function returns nonzero for success. If the function fails, an error occurs. For example, the following error occurs because lock names cannot be empty:

```
mysql> SELECT service_get_read_locks('mysamespace', '', 10);
ERROR 3131 (42000): Incorrect locking service lock name ''.
```

A session can acquire multiple locks for the same lock identifier. As long as a different session does not have a write lock for an identifier, the session can acquire any number of read or write locks. Each lock request for the identifier acquires a new lock. The following statements acquire three write locks with the same identifier, then three read locks for the same identifier:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock1', 'lock1', 0);
SELECT service_get_read_locks('ns', 'lock1', 'lock1', 'lock1', 0);
```

If you examine the Performance Schema `metadata_locks` table at this point, you will find that the session holds six distinct locks with the same (`ns, lock1`) identifier. (For details, see [Locking Service Monitoring](#).)

Because the session holds at least one write lock on (`ns, lock1`), no other session can acquire a lock for it, either read or write. If the session held only read locks for the identifier, other sessions could acquire read locks for it, but not write locks.

Locks for a single lock-acquisition call are acquired atomically, but atomicity does not hold across calls. Thus, for a statement such as the following, where `service_get_write_locks()` is called once per row of the result set, atomicity holds for each individual call, but not for the statement as a whole:

```
SELECT service_get_write_locks('ns', 'lock1', 'lock2', 0) FROM t1 WHERE ... ;
```

### Caution

Because the locking service returns a separate lock for each successful request for a given lock identifier, it is possible for a single statement to acquire a large number of locks. For example:

```
INSERT INTO ... SELECT service_get_write_locks('ns', t1.col_name, 0) FROM t1;
```

These types of statements may have certain adverse effects. For example, if the statement fails part way through and rolls back, locks acquired up to the point of failure will still exist. If the intent is for there to be a correspondence between rows inserted and locks acquired, that intent will not be satisfied. Also, if it is important that locks are granted in a certain order, be aware that result set order may differ depending on which execution plan the optimizer chooses. For these reasons, it may be best to limit applications to a single lock-acquisition call per statement.

## Locking Service Monitoring

The locking service is implemented using the MySQL Server metadata locks framework, so you monitor locking service locks acquired or waited for by examining the Performance Schema `metadata_locks` table.

First, enable the metadata lock instrument:

```
mysql> UPDATE performance_schema.setup_instruments SET ENABLED = 'YES'
-> WHERE NAME = 'wait/lock/metadata/sql/mdl';
```

Then acquire some locks and check the contents of the `metadata_locks` table:

```
mysql> SELECT service_get_write_locks('mynamespace', 'lock1', 0);
+-----+
| service_get_write_locks('mynamespace', 'lock1', 0) |
+-----+
| 1 |
+-----+
mysql> SELECT service_get_read_locks('mynamespace', 'lock2', 0);
+-----+
| service_get_read_locks('mynamespace', 'lock2', 0) |
+-----+
| 1 |
+-----+
mysql> SELECT OBJECT_TYPE, OBJECT_SCHEMA, OBJECT_NAME, LOCK_TYPE, LOCK_STATUS
-> FROM performance_schema.metadata_locks
-> WHERE OBJECT_TYPE = 'LOCKING SERVICE'\G
***** 1. row *****
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock1
LOCK_TYPE: EXCLUSIVE
LOCK_STATUS: GRANTED
***** 2. row *****
OBJECT_TYPE: LOCKING SERVICE
OBJECT_SCHEMA: mynamespace
OBJECT_NAME: lock2
LOCK_TYPE: SHARED
LOCK_STATUS: GRANTED
```

Locking service locks have an `OBJECT_TYPE` value of `LOCKING SERVICE`. This is distinct from, for example, locks acquired with the `GET_LOCK()` function, which have an `OBJECT_TYPE` of `USER LEVEL LOCK`.

The lock namespace, name, and mode appear in the `OBJECT_SCHEMA`, `OBJECT_NAME`, and `LOCK_TYPE` columns. Read and write locks have `LOCK_TYPE` values of `SHARED` and `EXCLUSIVE`, respectively.

The `LOCK_STATUS` value is `GRANTED` for an acquired lock, `PENDING` for a lock that is being waited for. You will see `PENDING` if one session holds a write lock and another session is attempting to acquire a lock having the same identifier.

## Locking Service UDF Interface Reference

The SQL interface to the locking service implements the user-defined functions described in this section. For usage examples, see [Using the UDF Locking Interface](#).

The functions share these characteristics:

- The return value is nonzero for success. Otherwise, an error occurs.
- Namespace and lock names must be non-`NULL`, nonempty, and have a maximum length of 64 characters.
- Timeout values must be integers indicating how many seconds to wait to acquire locks before giving up with an error. If the timeout is 0, there is no waiting and the function produces an error if locks cannot be acquired immediately.

These locking service UDFs are available:

- `service_get_read_locks(namespace, lock_name[, lock_name] ..., timeout)`

Acquires one or more read (shared) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_get_write_locks(namespace, lock_name[, lock_name] ..., timeout)`

Acquires one or more write (exclusive) locks in the given namespace using the given lock names, timing out with an error if the locks are not acquired within the given timeout value.

- `service_release_locks(namespace)`

For the given namespace, releases all locks that were acquired within the current session using `service_get_read_locks()` and `service_get_write_locks()`.

It is not an error for there to be no locks in the namespace.

## 28.3.2 The Keyring Service

MySQL Server supports a keyring service that enables internal server components and plugins to securely store sensitive information for later retrieval. This section describes how to use the keyring service functions to store, retrieve, and remove keys in the MySQL keyring keystore. An SQL interface to the keyring service functions is also available as a set of user-defined functions (UDFs); see [Section 6.5.4.8, “General-Purpose Keyring Key-Management Functions”](#). For general keyring information, see [Section 6.5.4, “The MySQL Keyring”](#).

The keyring service uses whatever underlying keyring plugin is enabled, if any. If no keyring plugin is enabled, keyring service calls fail.

A “record” in the keystore consists of data (the key itself) and a unique identifier through which the key is accessed. The identifier has two parts:

- `key_id`: The key ID or name. `key_id` values that begin with `mysql_` are reserved by MySQL Server.
- `user_id`: The session effective user ID. If there is no user context, this value can be `NULL`. The value need not actually be a “user”; the meaning depends on the application.

Functions that implement the keyring UDF interface pass the value of `CURRENT_USER()` as the `user_id` value to keyring service functions.

The keyring service functions have these characteristics in common:

- Each function returns 0 for success, 1 for failure.
- The `key_id` and `user_id` arguments form a unique combination indicating which key in the keyring to use.
- The `key_type` argument provides additional information about the key, such as its encryption method or intended use.
- Keyring service functions treat key IDs, user names, types, and values as binary strings, so comparisons are case sensitive. For example, IDs of `MyKey` and `mykey` refer to different keys.

These keyring service functions are available:

- `my_key_fetch()`

Deobfuscates and retrieves a key from the keyring, along with its type. The function allocates the memory for the buffers used to store the returned key and key type. The caller should zero or obfuscate the memory when it is no longer needed, then free it.

Syntax:

```
my_bool my_key_fetch(const char *key_id, const char **key_type,
                    const char* user_id, void **key, size_t *key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier indicating which key to fetch.
- `key_type`: The address of a buffer pointer. The function stores into it a pointer to a null-terminated string that provides additional information about the key (stored when the key was added).
- `key`: The address of a buffer pointer. The function stores into it a pointer to the buffer containing the fetched key data.
- `key_len`: The address of a variable into which the function stores the size in bytes of the `*key` buffer.

Return values:

Returns 0 for success, 1 for failure.

- `my_key_generate()`

Generates a new random key of a given type and length and stores it in the keyring. The key has a length of `key_len` and is associated with the identifier formed from `key_id` and `user_id`. The type and length values must be consistent with the values supported by the underlying keyring plugin. See [Section 6.5.4.7, “Supported Keyring Key Types”](#).

Syntax:

```
my_bool my_key_generate(const char *key_id, const char *key_type,
                       const char *user_id, size_t key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be generated.
- `key_type`: A null-terminated string that provides additional information about the key.
- `key_len`: The size in bytes of the key to be generated.

Return values:

Returns 0 for success, 1 for failure.

- `my_key_remove()`

Removes a key from the keyring.

Syntax:

```
my_bool my_key_remove(const char *key_id, const char* user_id)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be removed.

Return values:

Returns 0 for success, 1 for failure.

- `my_key_store()`

Obfuscates and stores a key in the keyring.

Syntax:

```
my_bool my_key_store(const char *key_id, const char *key_type,  
                    const char* user_id, void *key, size_t key_len)
```

Arguments:

- `key_id`, `user_id`: Null-terminated strings that as a pair form a unique identifier for the key to be stored.
- `key_type`: A null-terminated string that provides additional information about the key.
- `key`: The buffer containing the key data to be stored.
- `key_len`: The size in bytes of the `key` buffer.

Return values:

Returns 0 for success, 1 for failure.

## 28.4 Adding New Functions to MySQL

There are three ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as library files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 13.7.3.1, “CREATE FUNCTION Syntax for User-Defined Functions”](#).

- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.
- Another way to add functions is by creating stored functions. These are written using SQL statements rather than by compiling object code. The syntax for writing stored functions is not covered here. See [Section 23.2, “Using Stored Routines \(Procedures and Functions\)”](#).

Each method of creating compiled functions has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you need not do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a binary MySQL distribution. No access to MySQL source is necessary.
- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

See [Section 9.2.4, “Function Name Parsing and Resolution”](#), for the rules describing how the server interprets references to different kinds of functions.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the `sql/udf_example.cc` file that is provided in MySQL source distributions.

## 28.4.1 Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values and can accept arguments of those same types.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number, types, and names of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

## 28.4.2 Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ and your operating system must support dynamic loading. MySQL source distributions include a file `sql/udf_example.cc` that defines five UDF functions. Consult this file to see how UDF calling conventions work. The `include/mysql_com.h` header file defines UDF-related symbols and data structures, although you need not include this header file directly; it is included by `mysql.h`.

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. These constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.4, “MySQL Source-Configuration Options”](#), and [Section 2.9.5, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you must link `mysqld` dynamically. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`).

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

#### Note

When using C++ you can encapsulate your C functions within:

```
extern "C" { ... }
```

This ensures that your C++ function names remain readable in the completed UDF.

The following list describes the C/C++ functions that you write to implement the interface for a function named `xxx()`. The main function, `xxx()`, is required. In addition, a UDF requires at least one of the other functions described here, for reasons discussed in [Section 28.4.2.6, “UDF Security Precautions”](#).

- `xxx()`

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here.

SQL Type	C/C++ Type
<code>STRING</code>	<code>char *</code>
<code>INTEGER</code>	<code>long long</code>
<code>REAL</code>	<code>double</code>

It is also possible to declare a `DECIMAL` function, but currently the value is returned as a string, so you should write the UDF as though it were a `STRING` function. `ROW` functions are not implemented.

- `xxx_init()`

The initialization function for `xxx()`. If present, it can be used for the following purposes:

- To check the number of arguments to `xxx()`.
- To verify that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the required types when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()`

The deinitialization function for `xxx()`. If present, it should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `xxx()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main

or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_clear()`

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()`

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat steps 3 to 5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not permitted to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### 28.4.2.1 UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 28.4.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `XXX()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *result, unsigned long *length,
          char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
           char *is_null, char *error);
```

**DECIMAL** functions return string values and should be declared the same way as **STRING** functions. **ROW** functions are not implemented.

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);  
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a **UDF\_INIT** structure that is used to communicate information between functions. The **UDF\_INIT** structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member, leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return **NULL**. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. For example, if the function is passed 1.34, 1.345, and 1.3, the default would be 3, because 1.345 has 3 decimal digits.

For arguments that have no fixed number of decimals, the `decimals` value is set to 31, which is 1 more than the maximum number of decimals permitted for the **DECIMAL**, **FLOAT**, and **DOUBLE** data types. This value is available as the constant **NOT\_FIXED\_DEC** in the `mysql_com.h` header file.

A `decimals` value of 31 is used for arguments in cases such as a **FLOAT** or **DOUBLE** column declared without an explicit number of decimals (for example, **FLOAT** rather than **FLOAT(10,3)**) and for floating-point constants such as `1345E-3`. It is also used for string and other nonnumber arguments that might be converted within the function to numeric form.

The value to which the `decimals` member is initialized is only a default. It can be changed within the function to reflect the actual calculation performed. The default is determined such that the largest number of decimals of the arguments is used. If the number of decimals is **NOT\_FIXED\_DEC** for even one of the arguments, that is the value used for `decimals`.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

- `my_bool const_item`

`xxx_init()` should set `const_item` to 1 if `xxx()` always returns the same value and to 0 otherwise.

### 28.4.2.2 UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 28.4.2, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
void xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is not needed or used in MySQL 5.7, in which the UDF interface uses `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work with older versions of the server. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
void xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required by MySQL 5.7.

- `xxx_add()`

This function is called for all rows that belong to the same group. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
void xxx_add(UDF_INIT *initid, UDF_ARGS *args,
              char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a nonaggregate UDF. See [Section 28.4.2.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a nonaggregate UDF. See [Section 28.4.2.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for nonaggregate UDFs. See [Section 28.4.2.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

### 28.4.2.3 UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

For other `UDF_ARGS` member values that are arrays, array references are zero-based. That is, refer to array members using index values from 0 to `args->arg_count - 1`.

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, `REAL_RESULT`, and `DECIMAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

Arguments of type `DECIMAL_RESULT` are passed as strings, so you should handle them the same way as `STRING_RESULT` values.

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

Exact-value decimal arguments such as `1.3` or `DECIMAL` column values are passed with a type of `DECIMAL_RESULT`. However, the values are passed as strings. If you want to receive a number, use the initialization function to specify that the argument should be coerced to a `REAL_RESULT` value:

```
args->arg_type[2] = REAL_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See later for instructions on how to access the value properly.) For a nonconstant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as 3 or `4*7-2` or `SIN(3.14)`. A nonconstant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with nonconstant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to enable handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. Do not assume that the string is null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- For an argument of type `DECIMAL_RESULT`, the value is passed as a string and should be handled like a `STRING_RESULT` value.
- `ROW_RESULT` arguments are not implemented.
- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

- `char *maybe_null`

For the initialization function, the `maybe_null` array indicates for each argument whether the argument value might be null (0 if no, 1 if yes).

- `char **attributes`

`args->attributes` communicates information about the names of the UDF arguments. For argument `i`, the attribute name is available as a string in `args->attributes[i]` and the attribute length is `args->attribute_lengths[i]`. Do not assume that the string is null-terminated.

By default, the name of a UDF argument is the text of the expression used to specify the argument. For UDFs, an argument may also have an optional `[AS] alias_name` clause, in which case the argument name is `alias_name`. The `attributes` value for each argument thus depends on whether an alias was given.

Suppose that a UDF `my_udf()` is invoked as follows:

```
SELECT my_udf(expr1, expr2 AS alias1, expr3 alias2);
```

In this case, the `attributes` and `attribute_lengths` arrays will have these values:

```
args->attributes[0] = "expr1"
args->attribute_lengths[0] = 5

args->attributes[1] = "alias1"
args->attribute_lengths[1] = 6

args->attributes[2] = "alias2"
args->attribute_lengths[2] = 6
```

- `unsigned long *attribute_lengths`

The `attribute_lengths` array indicates the length of each argument name.

#### 28.4.2.4 UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*length` to the length (in bytes) of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

MySQL passes a buffer to the `xxx()` function using the `result` parameter. This buffer is sufficiently long to hold 255 characters, which can be multibyte characters. The `xxx()` function can store the result in this buffer if it fits, in which case the return value should be a pointer to the buffer. If the function stores the result in a different buffer, it should return a pointer to that buffer.

If your string function does not use the supplied buffer (for example, if it needs to return a string longer than 255 characters), you must allocate the space for your own buffer with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See [Section 28.4.2.1, “UDF Calling Sequences for Simple Functions”](#).

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `xxx()` was invoked. (`xxx()` is not even called for subsequent rows.)

#### 28.4.2.5 UDF Compiling and Installing

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.cc` that is included in MySQL source distributions.

If a UDF will be referred to in statements that will be replicated to slave servers, you must ensure that every slave also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.cc` file contains the following functions:

- `metaphon()` returns a metaphor string of the string argument. This is something like a soundex string, but it is more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP address for a host name.
- `reverse_lookup()` returns the host name for an IP address. The function may be called either with a single string argument of the form '`xxx.xxx.xxx.xxx`' or with four numbers.
- `avgcost()` returns an average cost. This is an aggregate function.

A dynamically loadable file should be compiled as a sharable library file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.cc
```

If you are using `gcc` with `CMake` (which is how MySQL is configured), you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example
```

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.cc` using `gcc` directly produces a file named `udf_example.so`. Copy the shared object to the server's plugin directory and name it `udf_example.so`. This directory is given by the value of the `plugin_dir` system variable.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. Obtain a MySQL source distribution. See [Section 2.1.2, "How to Get MySQL"](#).
2. Obtain the `CMake` build utility, if necessary, from <http://www.cmake.org>. (Version 2.6 or later is required).
3. In the source tree, look in the `sql` directory. There are files named `udf_example.def` and `udf_example.cc` there. Copy both files from this directory to your working directory.
4. Create a `CMake` makefile (`CMakeLists.txt`) with these contents:

```
PROJECT(udf_example)

# Path for MySQL include directory
```

```
INCLUDE_DIRECTORIES("c:/mysql/include")

ADD_DEFINITIONS("-DHAVE_DLOPEN")
ADD_LIBRARY(udf_example MODULE udf_example.cc udf_example.def)
TARGET_LINK_LIBRARIES(udf_example wsock32)
```

5. Create the VC project and solution files:

```
cmake -G "<Generator>"
```

Invoking `cmake --help` shows you a list of valid Generators.

6. Create `udf_example.dll`:

```
devenv udf_example.sln /build Release
```

After the shared library file has been installed, notify `mysqld` about the new functions with the following statements. If library files have a suffix different from `.so` on your system, substitute the correct suffix throughout (for example, `.dll` on Windows).

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION sequence RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.so';
```

Once installed, a function remains installed until it is uninstalled.

To delete functions, use `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION sequence;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` or `DELETE` privilege for the `mysql` database to create or drop functions, respectively.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

### 28.4.2.6 UDF Security Precautions

MySQL takes several measures to prevent misuse of user-defined functions.

UDF library files cannot be placed in arbitrary directories. They must be located in the server's plugin directory. This directory is given by the value of the `plugin_dir` system variable.

To use `CREATE FUNCTION` or `DROP FUNCTION`, you must have the `INSERT` or `DELETE` privilege, respectively, for the `mysql` database. This is necessary because those statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` also supports an `--allow-suspicious-udfs` option that controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared library files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

### 28.4.3 Adding a New Native Function

To add a new native MySQL function, use the procedure described here, which requires that you use a source distribution. You cannot add native functions to a binary distribution because it is necessary to modify MySQL source code and compile MySQL from the modified source. If you migrate to another version of MySQL (for example, when a new version is released), you must repeat the procedure with the new version.

If the new native function will be referred to in statements that will be replicated to slave servers, you must ensure that every slave server also has the function available. Otherwise, replication will fail on the slaves when they attempt to invoke the function.

To add a new native function, follow these steps to modify source files in the `sql` directory:

1. Create a subclass for the function in `item_create.cc`:
  - If the function takes a fixed number of arguments, create a subclass of `Create_func_arg0`, `Create_func_arg1`, `Create_func_arg2`, or `Create_func_arg3`, respectively, depending on whether the function takes zero, one, two, or three arguments. For examples, see the `Create_func_uuid`, `Create_func_abs`, `Create_func_pow`, and `Create_func_lpad` classes.
  - If the function takes a variable number of arguments, create a subclass of `Create_native_func`. For an example, see `Create_func_concat`.
2. To provide a name by which the function can be referred to in SQL statements, register the name in `item_create.cc` by adding a line to this array:

```
static Native_func_registry func_array[]
```

You can register several names for the same function. For example, see the lines for `"LCASE"` and `"LOWER"`, which are aliases for `Create_func_lcase`.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double    Item_func_newname::val()
longlong Item_func_newname::val_int()
String    *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. If the function is nondeterministic, include the following statement in the item constructor to indicate that function results should not be cached:

```
current_thd->lex->safe_to_cache_query=0;
```

A function is nondeterministic if, given fixed values for its arguments, it can return different results for different invocations.

6. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments. `max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function cannot return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. Look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, do not use any global or static variables in the functions without protecting them with mutexes.

If you want to return `NULL` from `::val()`, `::val_int()`, or `::str()`, you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result, or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

## 28.5 Debugging and Porting MySQL

This section helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See <https://www.mysql.com/support/supportedplatforms/database.html>. If you have created a new port of MySQL, please let us know so that we can list it here and on our website (<http://www.mysql.com/>), recommending it to other users.

### Note

If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server.

To build MySQL from source, your system must satisfy the tool requirements listed at [Section 2.9, “Installing MySQL from Source”](#).

### Important

If you are trying to build MySQL 5.7 with `icc` on the IA64 platform, and need support for NDB Cluster, you should first ensure that you are using `icc` version 9.1.043 or later. (For details, see Bug #21875.)

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section 28.5.1, “Debugging a MySQL Server”](#).

**Note**

Before you start debugging `mysqld`, first get the test program `mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

## 28.5.1 Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality). See [Section B.5.3.3, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` does not want to start, verify that you have no `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ....`

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients cannot connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you have not compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, MySQL Server Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.1, “General Installation Guidance”](#).

### 28.5.1.1 Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `-DWITH_DEBUG=1` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If `mysqld` stops crashing when you configure it with the `-DWITH_DEBUG=1` CMake option, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` using the `CMAKE_C_FLAGS` and `CMAKE_CXX_FLAGS` CMake options and not use `-DWITH_DEBUG=1`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.6.2, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.7, “How to Report Bugs or Problems”](#)).

### 28.5.1.2 Creating Trace Files

If the `mysqld` server does not start or it crashes easily, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it is compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld`.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

The trace file can become **very large**! To generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you cannot locate the wrong place, you can open a bug report and upload the trace file to the report, so that a MySQL developer can take a look at it. For instructions, see [Section 1.7, "How to Report Bugs or Problems"](#).

The trace file is made with the **DEBUG** package by Fred Fish. See [Section 28.5.3, "The DEBUG Package"](#).

### 28.5.1.3 Using WER with PDB to create a Windows crashdump

Program Database files (with suffix `.pdb`) are included in the **ZIP Archive Debug Binaries & Test Suite** distribution of MySQL. These files provide information for debugging your MySQL installation in the event of a problem. This is a separate download from the standard MSI or Zip file.

#### Note

As of MySQL 5.7.6, the PDB files are available in a separate file labeled "ZIP Archive Debug Binaries & Test Suite".

The PDB file contains more detailed information about `mysqld` and other tools that enables more detailed trace and dump files to be created. You can use these with `WinDbg` or Visual Studio to debug `mysqld`.

For more information on PDB files, see [Microsoft Knowledge Base Article 121366](#). For more information on the debugging options available, see [Debugging Tools for Windows](#).

To use `WinDbg`, either install the full Windows Driver Kit (WDK) or install the standalone version.

#### Important

The `.exe` and `.pdb` files must be an exact match (both version number and MySQL server edition) or `WinDBG` will complain while attempting to load the symbols.

1. To generate a minidump `mysqld.dmp`, enable the `core-file` option under the `[mysqld]` section in `my.ini`. Restart the MySQL server after making these changes.
2. Create a directory to store the generated files, such as `c:\symbols`

3. Determine the path to your `windbg.exe` executable using the Find GUI or from the command line, for example: `dir /s /b windbg.exe` -- a common default is `C:\Program Files\Debugging Tools for Windows (x64)\windbg.exe`
4. Launch `windbg.exe` giving it the paths to `mysqld-debug.exe`, `mysqld.pdb`, `mysqld.dmp`, and the source code. Alternatively, pass in each path from the WinDbg GUI. For example:

```
windbg.exe -i "C:\mysql-5.7.25-winx64\bin\" ^
-z "C:\mysql-5.7.25-winx64\data\mysqld.dmp" ^
-srcpath "E:\ade\mysql_archives\5.7\5.7.25\mysql-5.7.25" ^
-y "C:\mysql-5.7.25-winx64\bin;SRV*c:\symbols*http://msdl.microsoft.com/download/symbols" ^
-v -n -c "!analyze -vvvvv"
```

#### Note

The ^ character and newline are removed by the Windows command line processor, so be sure the spaces remain intact.

### 28.5.1.4 Debugging mysqld under gdb

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. It is best to upgrade to `gdb` 5.1 because thread debugging works much better with this version!

NPTL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

Use the `--gdb` option to `mysqld` to install an interrupt handler for `SIGINT` (needed to stop `mysqld` with ^C to set breakpoints) and disable stack tracing and core file handling.

It is very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` does not free the memory for old threads. You can avoid this problem by starting `mysqld` with `thread_cache_size` set to a value equal to `max_connections + 1`. In most cases just using `--thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb 5.x` and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the preceding output in a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

If `mysqld` hangs, you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl `DBI` interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

### 28.5.1.5 Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.4.2, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to `gcc`. See [Section 28.5.1.1, “Compiling MySQL for Debugging”](#).

A stack trace in the error log looks something like this:

```
mysqld got signal 11;
Attempting backtrace. You can use the following information
to find out where mysqld died. If you see no messages after
this, something went terribly wrong...

stack_bottom = 0x41fd0110 thread_stack 0x40000
mysqld(my_print_stacktrace+0x32)[0x9da402]
mysqld(handle_segfault+0x28a)[0x6648e9]
/lib/libpthread.so.0[0x7f1a5af000f0]
/lib/libc.so.6(strcmp+0x2)[0x7f1a5a10f0f2]
mysqld(_Z21check_change_passwordP3THDPKcS2_Pcj+0x7c)[0x7412cb]
mysqld(_ZN16set_var_password5checkEP3THD+0xd0)[0x688354]
mysqld(_Z17sql_set_variablesP3THDP4ListI12set_var_baseE+0x68)[0x688494]
mysqld(_Z21mysql_execute_commandP3THD+0x41a0)[0x67a170]
mysqld(_Z11mysql_parseP3THDPKcjPS2_+0x282)[0x67f0ad]
mysqld(_Z16dispatch_command19enum_server_commandP3THDPcj+0xbb7)[0x67fdf8]
mysqld(_Z10do_commandP3THD+0x24d)[0x6811b6]
mysqld(handle_one_connection+0x11c)[0x66e05e]
```

If resolution of function names for the trace fails, the trace contains less information:

```
mysqld got signal 11;
```

Attempting backtrace. You can use the following information to find out where mysqld died. If you see no messages after this, something went terribly wrong...

```
stack_bottom = 0x41fd0110 thread_stack 0x40000
[0x9da402]
[0x6648e9]
[0x7f1a5af000f0]
[0x7f1a5a10f0f2]
[0x7412cb]
[0x688354]
[0x688494]
[0x67a170]
[0x67f0ad]
[0x67fdf8]
[0x6811b6]
[0x66e05e]
```

In the latter case, you can use the `resolve_stack_dump` utility to determine where `mysqld` died by using the following procedure:

1. Copy the numbers from the stack trace to a file, for example `mysqld.stack`. The numbers should not include the surrounding square brackets:

```
0x9da402
0x6648e9
0x7f1a5af000f0
0x7f1a5a10f0f2
0x7412cb
0x688354
0x688494
0x67a170
0x67f0ad
0x67fdf8
0x6811b6
0x66e05e
```

2. Make a symbol file for the `mysqld` server:

```
shell> nm -n libexec/mysqld > /tmp/mysqld.sym
```

If `mysqld` is not linked statically, use the following command instead:

```
shell> nm -D -n libexec/mysqld > /tmp/mysqld.sym
```

If you want to decode C++ symbols, use the `--demangle`, if available, to `nm`. If your version of `nm` does not have this option, you will need to use the `c++filt` command after the stack dump has been produced to demangle the C++ names.

3. Execute the following command:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack
```

If you were not able to include demangled C++ names in your symbol file, process the `resolve_stack_dump` output using `c++filt`:

```
shell> resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack | c++filt
```

This prints out where `mysqld` died. If that does not help you find out why `mysqld` died, you should create a bug report and include the output from the preceding command with the bug report.

However, in most cases it does not help us to have just a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, in most cases we need to know the

statement that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.7, “How to Report Bugs or Problems”](#).

Newer versions of `glibc` stack trace functions also print the address as relative to the object. On `glibc`-based systems (Linux), the trace for a crash within a plugin looks something like:

```
plugin/auth/auth_test_plugin.so(+0x9a6)[0x7ff4d11c29a6]
```

To translate the relative address (`+0x9a6`) into a file name and line number, use this command:

```
shell> addr2line -fie auth_test_plugin.so 0x9a6
auth_test_plugin
mysql-trunk/plugin/auth/test_plugin.c:65
```

The `addr2line` utility is part of the `binutils` package on Linux.

On Solaris, the procedure is similar. The Solaris `printstack()` already prints relative addresses:

```
plugin/auth/auth_test_plugin.so:0x1510
```

To translate, use this command:

```
shell> gaddr2line -fie auth_test_plugin.so 0x1510
mysql-trunk/plugin/auth/test_plugin.c:88
```

Windows already prints the address, function name and line:

```
000007FEF07E10A4 auth_test_plugin.dll!auth_test_plugin()[test_plugin.c:72]
```

### 28.5.1.6 Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with the general query log enabled, you should check all your tables with `myisamchk`. See [Chapter 5, MySQL Server Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with the general query log enabled. See [Section 5.4.3, “The General Query Log”](#). When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you use the default general query log file, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that did not complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 13.8.2, “EXPLAIN Syntax”](#).

You can find the queries that take a long time to execute by starting `mysqld` with the slow query log enabled. See [Section 5.4.5, “The Slow Query Log”](#).

If you find the text `mysqld restarted` in the error log (normally a file named `host_name.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, MySQL Server Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this does not help and you cannot find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens,

MySQL writes an entry in the `hostname.err` file 'Warning: Checking table ...' which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.1.6, “Server Command Options”](#).

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example: `Got an error from thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

### 28.5.1.7 Making a Test Case If You Experience Table Corruption

The following procedure applies to `MyISAM` tables. For information about steps to take when encountering `InnoDB` table corruption, see [Section 1.7, “How to Report Bugs or Problems”](#).

If you encounter corrupted `MyISAM` tables or if `mysqld` always fails after some update statements, you can test whether the issue is reproducible by doing the following:

1. Stop the MySQL daemon with `mysqladmin shutdown`.
2. Make a backup of the tables to guard against the very unlikely case that the repair does something bad.
3. Check all tables with `myisamchk -s database/*.MYI`. Repair any corrupted tables with `myisamchk -r database/table.MYI`.
4. Make a second backup of the tables.
5. Remove (or move away) any old log files from the MySQL data directory if you need more space.
6. Start `mysqld` with the binary log enabled. If you want to find a statement that crashes `mysqld`, you should start the server with the general query log enabled as well. See [Section 5.4.3, “The General Query Log”](#), and [Section 5.4.4, “The Binary Log”](#).
7. When you have gotten a crashed table, stop the `mysqld` server.
8. Restore the backup.
9. Restart the `mysqld` server *without* the binary log enabled.
10. Re-execute the statements with `mysqlbinlog binary-log-file | mysql`. The binary log is saved in the MySQL database directory with the name `hostname-bin.NNNNNN`.
11. If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found a reproducible bug. FTP the tables and the binary log to our bugs database using the instructions given in [Section 1.7, “How to Report Bugs or Problems”](#). If you are a support customer, you can use the MySQL Customer Support Center (<https://www.mysql.com/support/>) to alert the MySQL team about the problem and have it fixed as soon as possible.

## 28.5.2 Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `-DWITH_DEBUG=1`. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:O,/tmp/client.trace
```

```
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:O,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.7, “How to Report Bugs or Problems”](#).

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

### 28.5.3 The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is doing. See [Section 28.5.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `debug` directory of MySQL source distributions. It's best to use a recent distribution to get the most updated DBUG manual.

The DBUG package can be used by invoking a program with the `--debug[=debug_options]` or `-# [debug_options]` option. If you specify the `--debug` or `-#` option without a `debug_options` value, most MySQL programs use a default value. The server default is `d:t:i:O,/tmp/mysqld.trace` on Unix and `d:t:i:O,\\mysqld.trace` on Windows. The effect of this default is:

- `d`: Enable output for all debug macros
- `t`: Trace function calls and exits
- `i`: Add PID to output lines
- `O,/tmp/mysqld.trace, O, \\mysqld.trace`: Set the debug output file.

Most client programs use a default `debug_options` value of `d:t:O,/tmp/program_name.trace`, regardless of platform.

Here are some example debug control strings as they might be specified on a shell command line:

```
--debug=d:t
--debug=d:f,main,subr1:F:L:t,20
--debug=d,input,output,files:n
--debug=d:t:i:O,\\mysqld.trace
```

For `mysqld`, it is also possible to change DBUG settings at runtime by setting the `debug` system variable. This variable has global and session values:

```
mysql> SET GLOBAL debug = 'debug_options';
mysql> SET SESSION debug = 'debug_options';
```

Changing the global `debug` value requires privileges sufficient to set global system variables. Changing the session `debug` value requires privileges sufficient to set restricted session system variables. See [Section 5.1.8.1, “System Variable Privileges”](#).

The `debug_options` value is a sequence of colon-separated fields:

```
field_1:field_2:...:field_N
```

Each field within the value consists of a mandatory flag character, optionally preceded by a `+` or `-` character, and optionally followed by a comma-delimited list of modifiers:

```
[+|-]flag[,modifier,modifier,...,modifier]
```

The following table describes the permitted flag characters. Unrecognized flag characters are silently ignored.

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_XXX</code> macros for the current state. May be followed by a list of keywords, which enables output only for the DBUG macros with that keyword. An empty list of keywords enables output for all macros.  In MySQL, common debug macro keywords to enable are <code>enter</code> , <code>exit</code> , <code>error</code> , <code>warning</code> , <code>info</code> , and <code>loop</code> .
<code>D</code>	Delay after each debugger output line. The argument is the delay, in tenths of seconds, subject to machine capabilities. For example, <code>D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. An empty list enables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0.
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

The leading `+` or `-` character and trailing list of modifiers are used for flag characters such as `d` or `f` that can enable a debug operation for all applicable modifiers or just some of them:

- With no leading `+` or `-`, the flag value is set to exactly the modifier list as given.
- With a leading `+` or `-`, the modifiers in the list are added to or subtracted from the current modifier list.

The following examples show how this works for the `d` flag. An empty `d` list enabled output for all debug macros. A nonempty list enables output only for the macro keywords in the list.

These statements set the `d` value to the modifier list as given:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d       |
+-----+
mysql> SET debug = 'd,error,warning';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,warning |
+-----+
```

A leading `+` or `-` adds to or subtracts from the current `d` value:

```
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,warning,loop |
+-----+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,warning |
+-----+
```

Adding to “all macros enabled” results in no change:

```
mysql> SET debug = 'd';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d       |
+-----+
mysql> SET debug = '+d,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d       |
+-----+
```

Disabling all enabled macros disables the `d` flag entirely:

```
mysql> SET debug = 'd,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
| d,error,loop |
+-----+
mysql> SET debug = '-d,error,loop';
mysql> SELECT @@debug;
+-----+
| @@debug |
+-----+
|         |
+-----+
```

**Note**

Prior to MySQL 5.7.2, the `+` and `-` modifiers were not always handled correctly and could leave a flag value in an incorrect state. Verify your `debug-setting` sequence in advance or set it without using `+` or `-`.

---

## Chapter 29 MySQL Enterprise Edition

### Table of Contents

29.1 MySQL Enterprise Monitor Overview .....	4245
29.2 MySQL Enterprise Backup Overview .....	4246
29.3 MySQL Enterprise Security Overview .....	4247
29.4 MySQL Enterprise Encryption Overview .....	4247

29.6 MySQL Enterprise Firewall Overview .....	4247
29.7 MySQL Enterprise Thread Pool Overview .....	4248

MySQL Enterprise Edition is a commercial product. Like MySQL Community Edition, MySQL Enterprise Edition includes MySQL Server, a fully integrated transaction-safe, ACID-compliant database with full commit, rollback, crash-recovery, and row-level locking capabilities. In addition, MySQL Enterprise Edition includes the following components designed to provide monitoring and online backup, as well as improved security and scalability:

The following sections briefly discuss each of these components and indicate where to find more detailed information. To learn more about commercial products, see <https://www.mysql.com/products/>.

### 29.1 MySQL Enterprise Monitor Overview

MySQL Enterprise Monitor is an enterprise monitoring system for MySQL that keeps an eye on your MySQL servers, notifies you of potential issues and problems, and advises you how to fix the issues. MySQL Enterprise Monitor can monitor all kinds of configurations, from a single MySQL server that is important to your business, all the way up to a huge farm of MySQL servers powering a busy website.

The following discussion briefly summarizes the basic components that make up the MySQL Enterprise Monitor product. For more information, see the MySQL Enterprise Monitor manual, available at <https://dev.mysql.com/doc/mysql-monitor/en/>.

MySQL Enterprise Monitor components can be installed in various configurations depending on your database and network topology, to give you the best combination of reliable and responsive monitoring data, with minimal overhead on the database server machines. A typical MySQL Enterprise Monitor installation consists of:

- One or more MySQL servers to monitor. MySQL Enterprise Monitor can monitor both Community and Enterprise MySQL server releases.
- A MySQL Enterprise Monitor Agent for each monitored host.
- A single MySQL Enterprise Service Manager, which collates information from the agents and provides the user interface to the collected data.

MySQL Enterprise Monitor is designed to monitor one or more MySQL servers. The monitoring information is collected by using an agent, *MySQL Enterprise Monitor Agent*. The agent communicates with the hosts and MySQL servers that it monitors, collecting variables, status and health information, and sending this information to the MySQL Enterprise Service Manager.

The information collected by the agent about each MySQL server and host you are monitoring is sent to the *MySQL Enterprise Service Manager*. This server collates all of the information from the agents. As it collates the information sent by the agents, the MySQL Enterprise Service Manager continually tests the collected data, comparing the status of the server to reasonable values. When thresholds are reached, the server can trigger an event (including an alarm and notification) to highlight a potential issue, such as low memory, high CPU usage, or more complex conditions such as insufficient buffer sizes and status information. We call each test, with its associated threshold value, a *rule*.

These rules, and the alarms and notifications, are each known as a *MySQL Enterprise Advisors*. Advisors form a critical part of the MySQL Enterprise Service Manager, as they provide warning information and troubleshooting advice about potential problems.

The MySQL Enterprise Service Manager includes a web server, and you interact with it through any web browser. This interface, the MySQL Enterprise Monitor User Interface, displays all of the information collected by the agents, and lets you view all of your servers and their current status as a group or individually. You control and configure all aspects of the service using the MySQL Enterprise Monitor User Interface.

The information supplied by the MySQL Enterprise Monitor Agent processes also includes statistical and query information, which you can view in the form of graphs. For example, you can view aspects such as server load, query numbers, or index usage information as a graph over time. The graph lets you pinpoint problems or potential issues on your server, and can help diagnose the impact from database or external problems (such as external system or network failure) by examining the data from a specific time interval.

The MySQL Enterprise Monitor Agent can also be configured to collect detailed information about the queries executed on your server, including the row counts and performance times for executing each query. You can correlate the detailed query data with the graphical information to identify which queries were executing when you experienced a particularly high load, index or other issue. The query data is supported by a system called Query Analyzer, and the data can be presented in different ways depending on your needs.

## 29.2 MySQL Enterprise Backup Overview

MySQL Enterprise Backup performs hot backup operations for MySQL databases. The product is architected for efficient and reliable backups of tables created by the InnoDB storage engine. For completeness, it can also back up tables from MyISAM and other storage engines.

The following discussion briefly summarizes MySQL Enterprise Backup. For more information, see the MySQL Enterprise Backup manual, available at <https://dev.mysql.com/doc/mysql-enterprise-backup/en/>.

Hot backups are performed while the database is running and applications are reading and writing to it. This type of backup does not block normal database operations, and it captures even changes that occur while the backup is happening. For these reasons, hot backups are desirable when your database “grows up” -- when the data is large enough that the backup takes significant time, and when your data is important enough to your business that you must capture every last change, without taking your application, website, or web service offline.

MySQL Enterprise Backup does a hot backup of all tables that use the InnoDB storage engine. For tables using MyISAM or other non-InnoDB storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. For efficient backup operations, you can designate InnoDB as the default storage engine for new tables, or convert existing tables to use the InnoDB storage engine.

## 29.3 MySQL Enterprise Security Overview

MySQL Enterprise Edition provides plugins that implement authentication using external services:

- MySQL Enterprise Edition includes an authentication plugin that enables MySQL Server to use PAM (Pluggable Authentication Modules) to authenticate MySQL users. PAM enables a system to use a standard interface to access various kinds of authentication methods, such as Unix passwords or an LDAP directory. For more information, see [Section 6.5.1.7, “PAM Pluggable Authentication”](#).
- MySQL Enterprise Edition includes an authentication plugin that performs external authentication on Windows, enabling MySQL Server to use native Windows services to authenticate client connections. Users who have logged in to Windows can connect from MySQL client programs to the server based on the information in their environment without specifying an additional password. For more information, see [Section 6.5.1.8, “Windows Pluggable Authentication”](#).
- MySQL Enterprise Edition includes a keyring plugin that uses Oracle Key Vault as a back end for keyring storage. For more information, see [Section 6.5.4, “The MySQL Keyring”](#).

For other related Enterprise security features, see [Section 29.4, “MySQL Enterprise Encryption Overview”](#).

## 29.4 MySQL Enterprise Encryption Overview

MySQL Enterprise Edition includes a set of encryption functions based on the OpenSSL library that expose OpenSSL capabilities at the SQL level. These functions enable Enterprise applications to perform the following operations:

- Implement added data protection using public-key asymmetric cryptography
- Create public and private keys and digital signatures
- Perform asymmetric encryption and decryption
- Use cryptographic hashing for digital signing and data verification and validation

For more information, see [Section 12.18, “MySQL Enterprise Encryption Functions”](#).

For other related Enterprise security features, see [Section 29.3, “MySQL Enterprise Security Overview”](#).

## 29.5 MySQL Enterprise Audit Overview

MySQL Enterprise Edition includes MySQL Enterprise Audit, implemented using a server plugin. MySQL Enterprise Audit uses the open MySQL Audit API to enable standard, policy-based monitoring and logging of connection and query activity executed on specific MySQL servers. Designed to meet the Oracle audit specification, MySQL Enterprise Audit provides an out of box, easy to use auditing and compliance solution for applications that are governed by both internal and external regulatory guidelines.

When installed, the audit plugin enables MySQL Server to produce a log file containing an audit record of server activity. The log contents include when clients connect and disconnect, and what actions they perform while connected, such as which databases and tables they access.

For more information, see [Section 6.5.5, “MySQL Enterprise Audit”](#).

## 29.6 MySQL Enterprise Firewall Overview

MySQL Enterprise Edition includes MySQL Enterprise Firewall, an application-level firewall that enables database administrators to permit or deny SQL statement execution based on matching

against whitelists of accepted statement patterns. This helps harden MySQL Server against attacks such as SQL injection or attempts to exploit applications by using them outside of their legitimate query workload characteristics.

Each MySQL account registered with the firewall has its own statement whitelist, enabling protection to be tailored per account. For a given account, the firewall can operate in recording or protecting mode, for training in the accepted statement patterns or protection against unacceptable statements.

For more information, see [Section 6.5.6, “MySQL Enterprise Firewall”](#).

## 29.7 MySQL Enterprise Thread Pool Overview

MySQL Enterprise Edition includes MySQL Enterprise Thread Pool, implemented using a server plugin. The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. In MySQL Enterprise Edition, a thread pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The plugin implements a thread pool that increases server performance by efficiently managing statement execution threads for large numbers of client connections.

For more information, see [Section 5.5.3, “MySQL Enterprise Thread Pool”](#).

---

## Chapter 30 MySQL Workbench

MySQL Workbench provides a graphical tool for working with MySQL servers and databases. MySQL Workbench fully supports MySQL versions 5.5 and higher.

The following discussion briefly describes MySQL Workbench capabilities. For more information, see the MySQL Workbench manual, available at <https://dev.mysql.com/doc/workbench/en/>.

MySQL Workbench provides five main areas of functionality:

- **SQL Development:** Enables you to create and manage connections to database servers. As well as enabling you to configure connection parameters, MySQL Workbench provides the capability to execute SQL queries on the database connections using the built-in SQL Editor. This functionality replaces that previously provided by the Query Browser standalone application.
- **Data Modeling:** Enables you to create models of your database schema graphically, reverse and forward engineer between a schema and a live database, and edit all aspects of your database using the comprehensive Table Editor. The Table Editor provides easy-to-use facilities for editing Tables, Columns, Indexes, Triggers, Partitioning, Options, Inserts and Privileges, Routines and Views.
- **Server Administration:** Enables you to create and administer server instances.
- **Data Migration:** Allows you to migrate from Microsoft SQL Server, Sybase ASE, SQLite, SQL Anywhere, PostgreSQL, and other RDBMS tables, objects and data to MySQL. Migration also supports migrating from earlier versions of MySQL to the latest releases.
- **MySQL Enterprise Support:** Support for Enterprise products such as MySQL Enterprise Backup and MySQL Audit.

MySQL Workbench is available in two editions, the Community Edition and the Commercial Edition. The Community Edition is available free of charge. The Commercial Edition provides additional Enterprise features, such as database documentation generation, at low cost.

---

# Appendix A MySQL 5.7 Frequently Asked Questions

## Table of Contents

A.1 MySQL 5.7 FAQ: General .....	4251
A.2 MySQL 5.7 FAQ: Storage Engines .....	4252
A.3 MySQL 5.7 FAQ: Server SQL Mode .....	4253
A.4 MySQL 5.7 FAQ: Stored Procedures and Functions .....	4254
A.5 MySQL 5.7 FAQ: Triggers .....	4258
A.6 MySQL 5.7 FAQ: Views .....	4260
A.7 MySQL 5.7 FAQ: INFORMATION_SCHEMA .....	4261
A.8 MySQL 5.7 FAQ: Migration .....	4261
A.9 MySQL 5.7 FAQ: Security .....	4262
A.10 MySQL 5.7 FAQ: NDB Cluster .....	4263
A.11 MySQL 5.7 FAQ: MySQL Chinese, Japanese, and Korean Character Sets .....	4275
A.12 MySQL 5.7 FAQ: Connectors & APIs .....	4287
A.13 MySQL 5.7 FAQ: Replication .....	4288
A.14 MySQL 5.7 FAQ: MySQL Enterprise Thread Pool .....	4291
A.15 MySQL 5.7 FAQ: InnoDB Change Buffer .....	4293
A.16 MySQL 5.7 FAQ: InnoDB Tablespace Encryption .....	4294
A.17 MySQL 5.7 FAQ: Virtualization Support .....	4297

## A.1 MySQL 5.7 FAQ: General

A.1.1 Which version of MySQL is production-ready (GA)? .....	4251
A.1.2 Can MySQL 5.7 do subqueries? .....	4252
A.1.3 Can MySQL 5.7 perform multiple-table inserts, updates, and deletes? .....	4252
A.1.4 Does MySQL 5.7 have a Query Cache? Does it work on Server, Instance or Database? .....	4252
A.1.5 Does MySQL 5.7 have Sequences? .....	4252
A.1.6 Does MySQL 5.7 have a <code>NOW()</code> function with fractions of seconds? .....	4252
A.1.7 Does MySQL 5.7 work with multi-core processors? .....	4252
A.1.8 Why do I see multiple processes for <code>mysqld</code> ? .....	4252
A.1.9 Can MySQL 5.7 perform ACID transactions? .....	4252

### A.1.1. Which version of MySQL is production-ready (GA)?

MySQL 8.0, 5.7, and MySQL 5.6 are supported for production use.

MySQL 8.0 achieved General Availability (GA) status with MySQL 8.0.11, which was released for production use on 19 April 2018.

MySQL 5.7 achieved General Availability (GA) status with MySQL 5.7.9, which was released for production use on 21 October 2015.

MySQL 5.6 achieved General Availability (GA) status with MySQL 5.6.10, which was released for production use on 5 February 2013.

MySQL 5.5 achieved General Availability (GA) status with MySQL 5.5.8, which was released for production use on 3 December 2010. The MySQL 5.5 series is no longer current, but still supported in production.

MySQL 5.1 achieved General Availability (GA) status with MySQL 5.1.30, which was released for production use on 14 November 2008. Active development for MySQL 5.1 has ended.

MySQL 5.0 achieved General Availability (GA) status with MySQL 5.0.15, which was released for production use on 19 October 2005. Active development for MySQL 5.0 has ended.

**A.1.2.** Can MySQL 5.7 do subqueries?

Yes. See [Section 13.2.10, “Subquery Syntax”](#).

**A.1.3.** Can MySQL 5.7 perform multiple-table inserts, updates, and deletes?

Yes. For the syntax required to perform multiple-table updates, see [Section 13.2.11, “UPDATE Syntax”](#); for that required to perform multiple-table deletes, see [Section 13.2.2, “DELETE Syntax”](#).

A multiple-table insert can be accomplished using a trigger whose `FOR EACH ROW` clause contains multiple `INSERT` statements within a `BEGIN . . . END` block. See [Section 23.3, “Using Triggers”](#).

**A.1.4.** Does MySQL 5.7 have a Query Cache? Does it work on Server, Instance or Database?

Yes. (However, the query cache is deprecated as of MySQL 5.7.20, and is removed in MySQL 8.0.) The query cache operates on the server level, caching complete result sets matched with the original query string. If an exactly identical query is made (which often happens, particularly in web applications), no parsing or execution is necessary; the result is sent directly from the cache. Various tuning options are available. See [Section 8.10.3, “The MySQL Query Cache”](#).

**A.1.5.** Does MySQL 5.7 have Sequences?

No. However, MySQL has an `AUTO_INCREMENT` system, which in MySQL 5.7 can also handle inserts in a multi-master replication setup. With the `auto_increment_increment` and `auto_increment_offset` system variables, you can set each server to generate auto-increment values that don't conflict with other servers. The `auto_increment_increment` value should be greater than the number of servers, and each server should have a unique offset.

**A.1.6.** Does MySQL 5.7 have a `NOW( )` function with fractions of seconds?

Yes, see [Section 11.3.6, “Fractional Seconds in Time Values”](#).

**A.1.7.** Does MySQL 5.7 work with multi-core processors?

Yes. MySQL is fully multithreaded, and will make use of multiple CPUs, provided that the operating system supports them.

**A.1.8.** Why do I see multiple processes for `mysqld`?

When using LinuxThreads, you should see a minimum of three `mysqld` processes running. These are in fact threads. There is one thread for the LinuxThreads manager, one thread to handle connections, and one thread to handle alarms and signals.

**A.1.9.** Can MySQL 5.7 perform ACID transactions?

Yes. All current MySQL versions support transactions. The `InnoDB` storage engine offers full ACID transactions with row-level locking, multi-versioning, nonlocking repeatable reads, and all four SQL standard isolation levels.

The `NDB` storage engine supports the `READ COMMITTED` transaction isolation level only.

## A.2 MySQL 5.7 FAQ: Storage Engines

A.2.1 Where can I obtain complete documentation for MySQL storage engines? .....	4253
A.2.2 Are there any new storage engines in MySQL 5.7? .....	4253
A.2.3 Have any storage engines been removed in MySQL 5.7? .....	4253
A.2.4 Can I prevent the use of a particular storage engine? .....	4253
A.2.5 Is there an advantage to using the <code>InnoDB</code> storage engine exclusively, as opposed to a combination of <code>InnoDB</code> and non- <code>InnoDB</code> storage engines? .....	4253

A.2.6 What are the unique benefits of the <a href="#">ARCHIVE</a> storage engine? .....	4253
---	------

**A.2.1.** Where can I obtain complete documentation for MySQL storage engines?

See [Chapter 15, \*Alternative Storage Engines\*](#). That chapter contains information about all MySQL storage engines except for the [InnoDB](#) storage engine and the [NDB](#) storage engine (used for MySQL Cluster). [InnoDB](#) is covered in [Chapter 14, \*The InnoDB Storage Engine\*](#). [NDB](#) is covered in [Chapter 21, \*MySQL NDB Cluster 7.5 and NDB Cluster 7.6\*](#).

**A.2.2.** Are there any new storage engines in MySQL 5.7?

No. [InnoDB](#) is the default storage engine for new tables. See [Section 14.1, “Introduction to InnoDB”](#) for details.

**A.2.3.** Have any storage engines been removed in MySQL 5.7?

No.

**A.2.4.** Can I prevent the use of a particular storage engine?

Yes. The [disabled\\_storage\\_engines](#) configuration option defines which storage engines cannot be used to create tables or tablespaces. By default, [disabled\\_storage\\_engines](#) is empty (no engines disabled), but it can be set to a comma-separated list of one or more engines.

**A.2.5.** Is there an advantage to using the [InnoDB](#) storage engine exclusively, as opposed to a combination of [InnoDB](#) and non-[InnoDB](#) storage engines?

Yes. Using [InnoDB](#) tables exclusively can simplify backup and recovery operations. MySQL Enterprise Backup does a [hot backup](#) of all tables that use the [InnoDB](#) storage engine. For tables using [MyISAM](#) or other non-[InnoDB](#) storage engines, it does a “warm” backup, where the database continues to run, but those tables cannot be modified while being backed up. See [Section 29.2, “MySQL Enterprise Backup Overview”](#).

**A.2.6.** What are the unique benefits of the [ARCHIVE](#) storage engine?

The [ARCHIVE](#) storage engine stores large amounts of data without indexes; it has a small footprint, and performs selects using table scans. See [Section 15.5, “The ARCHIVE Storage Engine”](#), for details.

## A.3 MySQL 5.7 FAQ: Server SQL Mode

A.3.1 What are server SQL modes? .....	4253
A.3.2 How many server SQL modes are there? .....	4253
A.3.3 How do you determine the server SQL mode? .....	4254
A.3.4 Is the mode dependent on the database or connection? .....	4254
A.3.5 Can the rules for strict mode be extended? .....	4254
A.3.6 Does strict mode impact performance? .....	4254
A.3.7 What is the default server SQL mode when MySQL 5.7 is installed? .....	4254

**A.3.1.** What are server SQL modes?

Server SQL modes define what SQL syntax MySQL should support and what kind of data validation checks it should perform. This makes it easier to use MySQL in different environments and to use MySQL together with other database servers. The MySQL Server apply these modes individually to different clients. For more information, see [Section 5.1.10, “Server SQL Modes”](#).

**A.3.2.** How many server SQL modes are there?

Each mode can be independently switched on and off. See [Section 5.1.10, “Server SQL Modes”](#), for a complete list of available modes.

**A.3.3. How do you determine the server SQL mode?**

You can set the default SQL mode (for `mysqld` startup) with the `--sql-mode` option. Using the statement `SET [GLOBAL|SESSION] sql_mode='modes'`, you can change the settings from within a connection, either locally to the connection, or to take effect globally. You can retrieve the current mode by issuing a `SELECT @@sql_mode` statement.

**A.3.4. Is the mode dependent on the database or connection?**

A mode is not linked to a particular database. Modes can be set locally to the session (connection), or globally for the server. you can change these settings using `SET [GLOBAL|SESSION] sql_mode='modes'`.

**A.3.5. Can the rules for strict mode be extended?**

When we refer to *strict mode*, we mean a mode where at least one of the modes `TRADITIONAL`, `STRICT_TRANS_TABLES`, or `STRICT_ALL_TABLES` is enabled. Options can be combined, so you can add restrictions to a mode. See [Section 5.1.10, “Server SQL Modes”](#), for more information.

**A.3.6. Does strict mode impact performance?**

The intensive validation of input data that some settings requires more time than if the validation is not done. While the performance impact is not that great, if you do not require such validation (perhaps your application already handles all of this), then MySQL gives you the option of leaving strict mode disabled. However, if you do require it, strict mode can provide such validation.

**A.3.7. What is the default server SQL mode when MySQL 5.7 is installed?**

The default SQL mode in MySQL 5.7 includes these modes: `ONLY_FULL_GROUP_BY`, `STRICT_TRANS_TABLES`, `NO_ZERO_IN_DATE`, `NO_ZERO_DATE`, `ERROR_FOR_DIVISION_BY_ZERO`, `NO_AUTO_CREATE_USER`, and `NO_ENGINE_SUBSTITUTION`.

For information about all available modes and default MySQL behavior, see [Section 5.1.10, “Server SQL Modes”](#).

## A.4 MySQL 5.7 FAQ: Stored Procedures and Functions

A.4.1 Does MySQL 5.7 support stored procedures and functions? .....	4255
A.4.2 Where can I find documentation for MySQL stored procedures and stored functions? .....	4255
A.4.3 Is there a discussion forum for MySQL stored procedures? .....	4255
A.4.4 Where can I find the ANSI SQL 2003 specification for stored procedures? .....	4255
A.4.5 How do you manage stored routines? .....	4255
A.4.6 Is there a way to view all stored procedures and stored functions in a given database? .....	4255
A.4.7 Where are stored procedures stored? .....	4255
A.4.8 Is it possible to group stored procedures or stored functions into packages? .....	4256
A.4.9 Can a stored procedure call another stored procedure? .....	4256
A.4.10 Can a stored procedure call a trigger? .....	4256
A.4.11 Can a stored procedure access tables? .....	4256
A.4.12 Do stored procedures have a statement for raising application errors? .....	4256
A.4.13 Do stored procedures provide exception handling? .....	4256
A.4.14 Can MySQL 5.7 stored routines return result sets? .....	4256
A.4.15 Is <code>WITH RECOMPILE</code> supported for stored procedures? .....	4256
A.4.16 Is there a MySQL equivalent to using <code>mod_plsql</code> as a gateway on Apache to talk directly to a stored procedure in the database? .....	4256
A.4.17 Can I pass an array as input to a stored procedure? .....	4256
A.4.18 Can I pass a cursor as an <code>IN</code> parameter to a stored procedure? .....	4256

A.4.19 Can I return a cursor as an <code>OUT</code> parameter from a stored procedure? .....	4256
A.4.20 Can I print out a variable's value within a stored routine for debugging purposes? .....	4256
A.4.21 Can I commit or roll back transactions inside a stored procedure? .....	4257
A.4.22 Do MySQL 5.7 stored procedures and functions work with replication? .....	4257
A.4.23 Are stored procedures and functions created on a master server replicated to a slave? .....	4257
A.4.24 How are actions that take place inside stored procedures and functions replicated? .....	4257
A.4.25 Are there special security requirements for using stored procedures and functions together with replication? .....	4257
A.4.26 What limitations exist for replicating stored procedure and function actions? .....	4257
A.4.27 Do the preceding limitations affect the ability of MySQL to do point-in-time recovery? .....	4258
A.4.28 What is being done to correct the aforementioned limitations? .....	4258

**A.4.1.** Does MySQL 5.7 support stored procedures and functions?

Yes. MySQL 5.7 supports two types of stored routines, stored procedures and stored functions.

**A.4.2.** Where can I find documentation for MySQL stored procedures and stored functions?

See [Section 23.2, “Using Stored Routines \(Procedures and Functions\)”](#).

**A.4.3.** Is there a discussion forum for MySQL stored procedures?

Yes. See <https://forums.mysql.com/list.php?98>.

**A.4.4.** Where can I find the ANSI SQL 2003 specification for stored procedures?

Unfortunately, the official specifications are not freely available (ANSI makes them available for purchase). However, there are books, such as *SQL-99 Complete, Really* by Peter Gultzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including coverage of stored procedures.

**A.4.5.** How do you manage stored routines?

It is always good practice to use a clear naming scheme for your stored routines. You can manage stored procedures with `CREATE [FUNCTION|PROCEDURE]`, `ALTER [FUNCTION|PROCEDURE]`, `DROP [FUNCTION|PROCEDURE]`, and `SHOW CREATE [FUNCTION|PROCEDURE]`. You can obtain information about existing stored procedures using the `ROUTINES` table in the `INFORMATION_SCHEMA` database (see [Section 24.21, “The INFORMATION\\_SCHEMA ROUTINES Table”](#)).

**A.4.6.** Is there a way to view all stored procedures and stored functions in a given database?

Yes. For a database named `dbname`, use this query on the `INFORMATION_SCHEMA.ROUTINES` table:

```
SELECT ROUTINE_TYPE, ROUTINE_NAME
FROM INFORMATION_SCHEMA.ROUTINES
WHERE ROUTINE_SCHEMA = 'dbname' ;
```

For more information, see [Section 24.21, “The INFORMATION\\_SCHEMA ROUTINES Table”](#).

The body of a stored routine can be viewed using `SHOW CREATE FUNCTION` (for a stored function) or `SHOW CREATE PROCEDURE` (for a stored procedure). See [Section 13.7.5.9, “SHOW CREATE PROCEDURE Syntax”](#), for more information.

**A.4.7.** Where are stored procedures stored?

In the `proc` table of the `mysql` system database. However, you should not access the tables in the system database directly. Instead, query the `INFORMATION_SCHEMA.ROUTINES` and `PARAMETERS` tables. See [Section 24.21, “The INFORMATION\\_SCHEMA ROUTINES Table”](#), and [Section 24.15, “The INFORMATION\\_SCHEMA PARAMETERS Table”](#).

You can also use `SHOW CREATE FUNCTION` to obtain information about stored functions, and `SHOW CREATE PROCEDURE` to obtain information about stored procedures. See [Section 13.7.5.9, “SHOW CREATE PROCEDURE Syntax”](#).

**A.4.8.** Is it possible to group stored procedures or stored functions into packages?

No. This is not supported in MySQL 5.7.

**A.4.9.** Can a stored procedure call another stored procedure?

Yes.

**A.4.10** Can a stored procedure call a trigger?

A stored procedure can execute an SQL statement, such as an `UPDATE`, that causes a trigger to activate.

**A.4.11** Can a stored procedure access tables?

Yes. A stored procedure can access one or more tables as required.

**A.4.12** Do stored procedures have a statement for raising application errors?

Yes. MySQL 5.7 implements the SQL standard `SIGNAL` and `RESIGNAL` statements. See [Section 13.6.7, “Condition Handling”](#).

**A.4.13** Do stored procedures provide exception handling?

MySQL implements `HANDLER` definitions according to the SQL standard. See [Section 13.6.7.2, “DECLARE ... HANDLER Syntax”](#), for details.

**A.4.14** Can MySQL 5.7 stored routines return result sets?

*Stored procedures* can, but *stored functions* cannot. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You need to use the MySQL 4.1 (or higher) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.15** Is `WITH RECOMPILE` supported for stored procedures?

Not in MySQL 5.7.

**A.4.16** Is there a MySQL equivalent to using `mod_plsql` as a gateway on Apache to talk directly to a stored procedure in the database?

There is no equivalent in MySQL 5.7.

**A.4.17** Can I pass an array as input to a stored procedure?

Not in MySQL 5.7.

**A.4.18** Can I pass a cursor as an `IN` parameter to a stored procedure?

In MySQL 5.7, cursors are available inside stored procedures only.

**A.4.19** Can I return a cursor as an `OUT` parameter from a stored procedure?

In MySQL 5.7, cursors are available inside stored procedures only. However, if you do not open a cursor on a `SELECT`, the result will be sent directly to the client. You can also `SELECT INTO` variables. See [Section 13.2.9, “SELECT Syntax”](#).

**A.4.20** Can I print out a variable's value within a stored routine for debugging purposes?

Yes, you can do this in a *stored procedure*, but not in a stored function. If you perform an ordinary `SELECT` inside a stored procedure, the result set is returned directly to the client. You will need to use the MySQL 4.1 (or above) client/server protocol for this to work. This means that, for example, in PHP, you need to use the `mysqli` extension rather than the old `mysql` extension.

**A.4.21** Can I commit or roll back transactions inside a stored procedure?

Yes. However, you cannot perform transactional operations within a stored function.

**A.4.22** Do MySQL 5.7 stored procedures and functions work with replication?

Yes, standard actions carried out in stored procedures and functions are replicated from a master MySQL server to a slave server. There are a few limitations that are described in detail in [Section 23.7, “Binary Logging of Stored Programs”](#).

**A.4.23** Are stored procedures and functions created on a master server replicated to a slave?

Yes, creation of stored procedures and functions carried out through normal DDL statements on a master server are replicated to a slave, so the objects will exist on both servers. `ALTER` and `DROP` statements for stored procedures and functions are also replicated.

**A.4.24** How are actions that take place inside stored procedures and functions replicated?

MySQL records each DML event that occurs in a stored procedure and replicates those individual actions to a slave server. The actual calls made to execute stored procedures are not replicated.

Stored functions that change data are logged as function invocations, not as the DML events that occur inside each function.

**A.4.25** Are there special security requirements for using stored procedures and functions together with replication?

Yes. Because a slave server has authority to execute any statement read from a master's binary log, special security constraints exist for using stored functions with replication. If replication or binary logging in general (for the purpose of point-in-time recovery) is active, then MySQL DBAs have two security options open to them:

1. Any user wishing to create stored functions must be granted the `SUPER` privilege.
2. Alternatively, a DBA can set the `log_bin_trust_function_creators` system variable to 1, which enables anyone with the standard `CREATE ROUTINE` privilege to create stored functions.

**A.4.26** What limitations exist for replicating stored procedure and function actions?

Nondeterministic (random) or time-based actions embedded in stored procedures may not replicate properly. By their very nature, randomly produced results are not predictable and cannot be exactly reproduced, and therefore, random actions replicated to a slave will not mirror those performed on a master. Declaring stored functions to be `DETERMINISTIC` or setting the `log_bin_trust_function_creators` system variable to 0 will not allow random-valued operations to be invoked.

In addition, time-based actions cannot be reproduced on a slave because the timing of such actions in a stored procedure is not reproducible through the binary log used for replication. It records only DML events and does not factor in timing constraints.

Finally, nontransactional tables for which errors occur during large DML actions (such as bulk inserts) may experience replication issues in that a master may be partially updated from DML activity, but no updates are done to the slave because of the errors that occurred. A workaround

is for a function's DML actions to be carried out with the `IGNORE` keyword so that updates on the master that cause errors are ignored and updates that do not cause errors are replicated to the slave.

**A.4.27** Do the preceding limitations affect the ability of MySQL to do point-in-time recovery?

The same limitations that affect replication do affect point-in-time recovery.

**A.4.28** What is being done to correct the aforementioned limitations?

You can choose either statement-based replication or row-based replication. The original replication implementation is based on statement-based binary logging. Row-based binary logging resolves the limitations mentioned earlier.

*Mixed* replication is also available (by starting the server with `--binlog-format=mixed`). This hybrid form of replication “knows” whether statement-level replication can safely be used, or row-level replication is required.

For additional information, see [Section 16.2.1, “Replication Formats”](#).

## A.5 MySQL 5.7 FAQ: Triggers

A.5.1 Where can I find the documentation for MySQL 5.7 triggers? .....	4258
A.5.2 Is there a discussion forum for MySQL Triggers? .....	4258
A.5.3 Does MySQL 5.7 have statement-level or row-level triggers? .....	4258
A.5.4 Are there any default triggers? .....	4258
A.5.5 How are triggers managed in MySQL? .....	4258
A.5.6 Is there a way to view all triggers in a given database? .....	4259
A.5.7 Where are triggers stored? .....	4259
A.5.8 Can a trigger call a stored procedure? .....	4259
A.5.9 Can triggers access tables? .....	4259
A.5.10 Can a table have multiple triggers with the same trigger event and action time? .....	4259
A.5.11 Can triggers call an external application through a UDF? .....	4259
A.5.12 Is it possible for a trigger to update tables on a remote server? .....	4259
A.5.13 Do triggers work with replication? .....	4259
A.5.14 How are actions carried out through triggers on a master replicated to a slave? .....	4260

**A.5.1.** Where can I find the documentation for MySQL 5.7 triggers?

See [Section 23.3, “Using Triggers”](#).

**A.5.2.** Is there a discussion forum for MySQL Triggers?

Yes. It is available at <https://forums.mysql.com/list.php?99>.

**A.5.3.** Does MySQL 5.7 have statement-level or row-level triggers?

In MySQL 5.7, all triggers are `FOR EACH ROW`; that is, the trigger is activated for each row that is inserted, updated, or deleted. MySQL 5.7 does not support triggers using `FOR EACH STATEMENT`.

**A.5.4.** Are there any default triggers?

Not explicitly. MySQL does have specific special behavior for some `TIMESTAMP` columns, as well as for columns which are defined using `AUTO_INCREMENT`.

**A.5.5.** How are triggers managed in MySQL?

In MySQL 5.7, triggers can be created using the `CREATE TRIGGER` statement, and dropped using `DROP TRIGGER`. See [Section 13.1.20, “CREATE TRIGGER Syntax”](#), and [Section 13.1.31, “DROP TRIGGER Syntax”](#), for more about these statements.

Information about triggers can be obtained by querying the `INFORMATION_SCHEMA.TRIGGERS` table. See [Section 24.29, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

**A.5.6.** Is there a way to view all triggers in a given database?

Yes. You can obtain a listing of all triggers defined on database `dbname` using a query on the `INFORMATION_SCHEMA.TRIGGERS` table such as the one shown here:

```
SELECT TRIGGER_NAME, EVENT_MANIPULATION, EVENT_OBJECT_TABLE, ACTION_STATEMENT
FROM INFORMATION_SCHEMA.TRIGGERS
WHERE TRIGGER_SCHEMA='dbname' ;
```

For more information about this table, see [Section 24.29, “The INFORMATION\\_SCHEMA TRIGGERS Table”](#).

You can also use the `SHOW TRIGGERS` statement, which is specific to MySQL. See [Section 13.7.5.38, “SHOW TRIGGERS Syntax”](#).

**A.5.7.** Where are triggers stored?

Triggers are stored in `.TRG` files, with one such file one per table.

**A.5.8.** Can a trigger call a stored procedure?

Yes.

**A.5.9.** Can triggers access tables?

A trigger can access both old and new data in its own table. A trigger can also affect other tables, but it is not permitted to modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.

**A.5.10** Can a table have multiple triggers with the same trigger event and action time?

It is possible to define multiple triggers for a given table that have the same trigger event and action time. For example, you can have two `BEFORE UPDATE` triggers for a table. By default, triggers that have the same trigger event and action time activate in the order they were created. To affect trigger order, specify a clause after `FOR EACH ROW` that indicates `FOLLOWS` or `PRECEDES` and the name of an existing trigger that also has the same trigger event and action time. With `FOLLOWS`, the new trigger activates after the existing trigger. With `PRECEDES`, the new trigger activates before the existing trigger.

**A.5.11** Can triggers call an external application through a UDF?

Yes. For example, a trigger could invoke the `sys_exec()` UDF.

**A.5.12** Is it possible for a trigger to update tables on a remote server?

Yes. A table on a remote server could be updated using the `FEDERATED` storage engine. (See [Section 15.8, “The FEDERATED Storage Engine”](#)).

**A.5.13** Do triggers work with replication?

Yes. However, the way in which they work depends whether you are using MySQL's “classic” statement-based or row-based replication format.

When using statement-based replication, triggers on the slave are executed by statements that are executed on the master (and replicated to the slave).

When using row-based replication, triggers are not executed on the slave due to statements that were run on the master and then replicated to the slave. Instead, when using row-based replication, the changes caused by executing the trigger on the master are applied on the slave.

For more information, see [Section 16.4.1.35, “Replication and Triggers”](#).

#### A.5.14 How are actions carried out through triggers on a master replicated to a slave?

Again, this depends on whether you are using statement-based or row-based replication.

**Statement-based replication.** First, the triggers that exist on a master must be re-created on the slave server. Once this is done, the replication flow works as any other standard DML statement that participates in replication. For example, consider a table `EMP` that has an `AFTER` insert trigger, which exists on a master MySQL server. The same `EMP` table and `AFTER` insert trigger exist on the slave server as well. The replication flow would be:

1. An `INSERT` statement is made to `EMP`.
2. The `AFTER` trigger on `EMP` activates.
3. The `INSERT` statement is written to the binary log.
4. The replication slave picks up the `INSERT` statement to `EMP` and executes it.
5. The `AFTER` trigger on `EMP` that exists on the slave activates.

**Row-based replication.** When you use row-based replication, the changes caused by executing the trigger on the master are applied on the slave. However, the triggers themselves are not actually executed on the slave under row-based replication. This is because, if both the master and the slave applied the changes from the master and, in addition, the trigger causing these changes were applied on the slave, the changes would in effect be applied twice on the slave, leading to different data on the master and the slave.

In most cases, the outcome is the same for both row-based and statement-based replication. However, if you use different triggers on the master and slave, you cannot use row-based replication. (This is because the row-based format replicates the changes made by triggers executing on the master to the slaves, rather than the statements that caused the triggers to execute, and the corresponding triggers on the slave are not executed.) Instead, any statements causing such triggers to be executed must be replicated using statement-based replication.

For more information, see [Section 16.4.1.35, “Replication and Triggers”](#).

## A.6 MySQL 5.7 FAQ: Views

A.6.1 Where can I find documentation covering MySQL Views? .....	4260
A.6.2 Is there a discussion forum for MySQL Views? .....	4260
A.6.3 What happens to a view if an underlying table is dropped or renamed? .....	4260
A.6.4 Does MySQL 5.7 have table snapshots? .....	4261
A.6.5 Does MySQL 5.7 have materialized views? .....	4261
A.6.6 Can you insert into views that are based on joins? .....	4261

#### A.6.1. Where can I find documentation covering MySQL Views?

See [Section 23.5, “Using Views”](#).

#### A.6.2. Is there a discussion forum for MySQL Views?

Yes. See <https://forums.mysql.com/list.php?100>

#### A.6.3. What happens to a view if an underlying table is dropped or renamed?

After a view has been created, it is possible to drop or alter a table or view to which the definition refers. To check a view definition for problems of this kind, use the `CHECK TABLE` statement. (See [Section 13.7.2.2, “CHECK TABLE Syntax”](#).)

**A.6.4.** Does MySQL 5.7 have table snapshots?

No.

**A.6.5.** Does MySQL 5.7 have materialized views?

No.

**A.6.6.** Can you insert into views that are based on joins?

It is possible, provided that your [INSERT](#) statement has a column list that makes it clear there is only one table involved.

You *cannot* insert into multiple tables with a single insert on a view.

## A.7 MySQL 5.7 FAQ: INFORMATION\_SCHEMA

A.7.1 Where can I find documentation for the MySQL [INFORMATION\\_SCHEMA](#) database? ..... 4261

A.7.2 Is there a discussion forum for [INFORMATION\\_SCHEMA](#)? ..... 4261

A.7.3 Where can I find the ANSI SQL 2003 specification for [INFORMATION\\_SCHEMA](#)? ..... 4261

A.7.4 What is the difference between the Oracle Data Dictionary and MySQL [INFORMATION\\_SCHEMA](#)? ..... 4261

A.7.5 Can I add to or otherwise modify the tables found in the [INFORMATION\\_SCHEMA](#) database? 4261

**A.7.1.** Where can I find documentation for the MySQL [INFORMATION\\_SCHEMA](#) database?

See [Chapter 24, INFORMATION\\_SCHEMA Tables](#)

**A.7.2.** Is there a discussion forum for [INFORMATION\\_SCHEMA](#)?

See <https://forums.mysql.com/list.php?101>.

**A.7.3.** Where can I find the ANSI SQL 2003 specification for [INFORMATION\\_SCHEMA](#)?

Unfortunately, the official specifications are not freely available. (ANSI makes them available for purchase.) However, there are books available, such as *SQL-99 Complete, Really* by Peter Gulutzan and Trudy Pelzer, that provide a comprehensive overview of the standard, including [INFORMATION\\_SCHEMA](#).

**A.7.4.** What is the difference between the Oracle Data Dictionary and MySQL [INFORMATION\\_SCHEMA](#)?

Both Oracle and MySQL provide metadata in tables. However, Oracle and MySQL use different table names and column names. The MySQL implementation is more similar to those found in DB2 and SQL Server, which also support [INFORMATION\\_SCHEMA](#) as defined in the SQL standard.

**A.7.5.** Can I add to or otherwise modify the tables found in the [INFORMATION\\_SCHEMA](#) database?

No. Since applications may rely on a certain standard structure, this should not be modified. For this reason, *we cannot support bugs or other issues which result from modifying [INFORMATION\\_SCHEMA](#) tables or data.*

## A.8 MySQL 5.7 FAQ: Migration

A.8.1 Where can I find information on how to migrate from MySQL 5.6 to MySQL 5.7? ..... 4261

A.8.2 How has storage engine (table type) support changed in MySQL 5.7 from previous versions? ..... 4262

**A.8.1.** Where can I find information on how to migrate from MySQL 5.6 to MySQL 5.7?

For detailed upgrade information, see [Section 2.11.1, “Upgrading MySQL”](#). Do not skip a major version when upgrading, but rather complete the process in steps, upgrading from one major

version to the next in each step. This may seem more complicated, but it will you save time and trouble. If you encounter problems during the upgrade, their origin will be easier to identify, either by you or, if you have a MySQL Enterprise subscription, by MySQL support.

#### A.8.2. How has storage engine (table type) support changed in MySQL 5.7 from previous versions?

Storage engine support has changed as follows:

- Support for [ISAM](#) tables was removed in MySQL 5.0 and you should now use the [MyISAM](#) storage engine in place of [ISAM](#). To convert a table [tblname](#) from [ISAM](#) to [MyISAM](#), simply issue a statement such as this one:

```
ALTER TABLE tblname ENGINE=MYISAM;
```

- Internal [RAID](#) for [MyISAM](#) tables was also removed in MySQL 5.0. This was formerly used to allow large tables in file systems that did not support file sizes greater than 2GB. All modern file systems allow for larger tables; in addition, there are now other solutions such as [MERGE](#) tables and views.
- The [VARCHAR](#) column type now retains trailing spaces in all storage engines.
- [MEMORY](#) tables (formerly known as [HEAP](#) tables) can also contain [VARCHAR](#) columns.

## A.9 MySQL 5.7 FAQ: Security

A.9.1 Where can I find documentation that addresses security issues for MySQL? .....	4262
A.9.2 What is the default authentication plugin in MySQL 5.7? .....	4262
A.9.3 Does MySQL 5.7 have native support for SSL? .....	4263
A.9.4 Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it? .....	4263
A.9.5 Does MySQL 5.7 have built-in authentication against LDAP directories? .....	4263
A.9.6 Does MySQL 5.7 include support for Roles Based Access Control (RBAC)? .....	4263

#### A.9.1. Where can I find documentation that addresses security issues for MySQL?

The best place to start is [Chapter 6, Security](#).

Other portions of the MySQL Documentation which you may find useful with regard to specific security concerns include the following:

- [Section 6.1.1, “Security Guidelines”](#).
- [Section 6.1.3, “Making MySQL Secure Against Attackers”](#).
- [Section B.5.3.2, “How to Reset the Root Password”](#).
- [Section 6.1.5, “How to Run MySQL as a Normal User”](#).
- [Section 28.4.2.6, “UDF Security Precautions”](#).
- [Section 6.1.4, “Security-Related mysqld Options and Variables”](#).
- [Section 6.1.6, “Security Issues with LOAD DATA LOCAL”](#).
- [Section 2.10, “Postinstallation Setup and Testing”](#).
- [Section 6.4, “Using Encrypted Connections”](#).

#### A.9.2. What is the default authentication plugin in MySQL 5.7?

The default authentication plugin in MySQL 5.7 is [mysql\\_native\\_password](#). For information about this plugin, see [Section 6.5.1.1, “Native Pluggable Authentication”](#). For general information

about pluggable authentication and other available authentication plugins, see [Section 6.3.9, “Pluggable Authentication”](#), and [Section 6.5.1, “Authentication Plugins”](#).

#### A.9.3. Does MySQL 5.7 have native support for SSL?

Most 5.7 binaries have support for SSL connections between the client and server. See [Section 6.4, “Using Encrypted Connections”](#).

You can also tunnel a connection using SSH, if (for example) the client application does not support SSL connections. For an example, see [Section 6.4.7, “Connecting to MySQL Remotely from Windows with SSH”](#).

#### A.9.4. Is SSL support built into MySQL binaries, or must I recompile the binary myself to enable it?

Most 5.7 binaries have SSL enabled for client/server connections that are secured, authenticated, or both. See [Section 6.4, “Using Encrypted Connections”](#).

#### A.9.5. Does MySQL 5.7 have built-in authentication against LDAP directories?

The Enterprise edition includes a [PAM Authentication Plugin](#) that supports authentication against an LDAP directory.

#### A.9.6. Does MySQL 5.7 include support for Roles Based Access Control (RBAC)?

Not at this time.

## A.10 MySQL 5.7 FAQ: NDB Cluster

In the following section, we answer questions that are frequently asked about NDB Cluster and the [NDB](#) storage engine.

A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source? .....	4264
A.10.2 What do “NDB” and “NDBCLUSTER” mean? .....	4264
A.10.3 What is the difference between using NDB Cluster versus using MySQL Replication? .....	4265
A.10.4 Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate? .....	4265
A.10.5 How many computers do I need to run an NDB Cluster, and why? .....	4265
A.10.6 What do the different computers do in an NDB Cluster? .....	4265
A.10.7 When I run the <a href="#">SHOW</a> command in the NDB Cluster management client, I see a line of output that looks like this: .....	4266
A.10.8 With which operating systems can I use NDB Cluster? .....	4266
A.10.9 What are the hardware requirements for running NDB Cluster? .....	4267
A.10.10 How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all? ..	4267
A.10.11 What file systems can I use with NDB Cluster? What about network file systems or network shares? .....	4268
A.10.12 Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)? .....	4268
A.10.13 I am trying to populate an NDB Cluster database. The loading process terminates prematurely and I get an error message like this one: .....	4268
A.10.14 NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations? .....	4269
A.10.15 Do I have to learn a new programming or query language to use NDB Cluster? .....	4269
A.10.16 What programming languages and APIs are supported by NDB Cluster? .....	4269
A.10.17 Does NDB Cluster include any management tools? .....	4270
A.10.18 How do I find out what an error or warning message means when using NDB Cluster? ...	4270
A.10.19 Is NDB Cluster transaction-safe? What isolation levels are supported? .....	4270
A.10.20 What storage engines are supported by NDB Cluster? .....	4270
A.10.21 In the event of a catastrophic failure—for example, the whole city loses power <i>and</i> my UPS fails—would I lose all my data? .....	4270
A.10.22 Is it possible to use <a href="#">FULLTEXT</a> indexes with NDB Cluster? .....	4270

A.10.23 Can I run multiple nodes on a single computer? .....	4270
A.10.24 Can I add data nodes to an NDB Cluster without restarting it? .....	4271
A.10.25 Are there any limitations that I should be aware of when using NDB Cluster? .....	4271
A.10.26 Does NDB Cluster support foreign keys? .....	4272
A.10.27 How do I import an existing MySQL database into an NDB Cluster? .....	4272
A.10.28 How do NDB Cluster nodes communicate with one another? .....	4272
A.10.29 What is an <i>arbitrator</i> ? .....	4272
A.10.30 What data types are supported by NDB Cluster? .....	4272
A.10.31 How do I start and stop NDB Cluster? .....	4273
A.10.32 What happens to NDB Cluster data when the NDB Cluster is shut down? .....	4274
A.10.33 Is it a good idea to have more than one management node for an NDB Cluster? .....	4274
A.10.34 Can I mix different kinds of hardware and operating systems in one NDB Cluster? .....	4274
A.10.35 Can I run two data nodes on a single host? Two SQL nodes? .....	4274
A.10.36 Can I use host names with NDB Cluster? .....	4274
A.10.37 Does NDB Cluster support IPv6? .....	4274
A.10.38 How do I handle MySQL users in an NDB Cluster having multiple MySQL servers? .....	4274
A.10.39 How do I continue to send queries in the event that one of the SQL nodes fails? .....	4274
A.10.40 How do I back up and restore an NDB Cluster? .....	4275
A.10.41 What is an “angel process”? .....	4275

#### A.10.1 Which versions of the MySQL software support NDB Cluster? Do I have to compile from source?

NDB Cluster is not supported in standard MySQL Server 5.7 releases. Instead, MySQL NDB Cluster is provided as a separate product. Available NDB Cluster release series include the following:

- **NDB Cluster 7.3.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production, although we recommend that new deployments use the latest NDB Cluster 7.6 release. The most recent NDB Cluster 7.3 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.4.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production, although we recommend that new deployments use the latest NDB Cluster 7.6 release. The most recent NDB Cluster 7.4 release can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.5.** This series is a previous General Availability (GA) version of NDB Cluster, still available for production, although we recommend that new deployments use the latest NDB Cluster 7.6 release. The latest NDB Cluster 7.5 releases can be obtained from <https://dev.mysql.com/downloads/cluster/>.
- **NDB Cluster 7.6.** This series is the most recent General Availability (GA) version of NDB Cluster, based on version 7.6 of the [NDB](#) storage engine and MySQL Server 5.7. NDB Cluster 7.6 is available for production use; new deployments intended for production should use the latest GA release in this series, which is currently NDB Cluster 7.6.9. You can obtain the most recent NDB Cluster 7.6 release from <https://dev.mysql.com/downloads/cluster/>. For information about new features and other important changes in this series, see [Section 21.1.4.2, “What is New in NDB Cluster 7.6”](#).

You should use NDB Cluster 7.6 for any new deployments; if you are using an older version of NDB Cluster, you should upgrade to this version soon as possible. For an overview of improvements made in NDB Cluster 7.6, see [Section 21.1.4.2, “What is New in NDB Cluster 7.6”](#). For an overview of improvements made in NDB Cluster 7.5, see [Section 21.1.4.1, “What is New in NDB Cluster 7.5”](#).

#### A.10.2 What do “NDB” and “NDBCLUSTER” mean?

“NDB” stands for “**N**etwork **D**atabase”. [NDB](#) and [NDBCLUSTER](#) are both names for the storage engine that enables clustering support with MySQL. [NDB](#) is preferred, but either name is correct.

**A.10.3**What is the difference between using NDB Cluster versus using MySQL Replication?

In traditional MySQL replication, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In NDB Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is *asynchronous*, NDB Cluster is *synchronous*.

Asynchronous replication is also available in NDB Cluster. *NDB Cluster Replication* (also sometimes known as “geo-replication”) includes the capability to replicate both between two NDB Clusters, and from an NDB Cluster to a non-Cluster MySQL server. See [Section 21.6, “NDB Cluster Replication”](#).

**A.10.4**Do I need any special networking to run NDB Cluster? How do computers in a cluster communicate?

NDB Cluster is intended to be used in a high-bandwidth environment, with computers connecting using TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for NDB Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

**A.10.5**How many computers do I need to run an NDB Cluster, and why?

A minimum of three computers is required to run a viable cluster. However, the minimum *recommended* number of computers in an NDB Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

To provide increased throughput and high availability, you should use multiple SQL nodes (MySQL Servers connected to the cluster). It is also possible (although not strictly necessary) to run multiple management servers.

**A.10.6**What do the different computers do in an NDB Cluster?

An NDB Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each corresponding to a specific role within the cluster. These are:

- **Management node.** This node provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control NDB Cluster is `ndb_mgm`. See [Section 21.4.4, “ndb\\_mgmd — The NDB Cluster Management Server Daemon”](#), and [Section 21.4.5, “ndb\\_mgm — The NDB Cluster Management Client”](#), for information about these programs.
- **Data node.** This type of node stores and replicates data. Data node functionality is handled by instances of the [NDB data node process](#) `ndbd`. For more information, see [Section 21.4.1, “ndbd — The NDB Cluster Data Node Daemon”](#).
- **SQL node.** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDBCLUSTER` storage engine and started with the `--ndb-cluster` option to enable the engine and the `--ndb-connectstring` option to enable it to connect to an NDB Cluster

management server. For more about these options, see [MySQL Server Options for NDB Cluster](#).

#### Note

An *API node* is any application that makes direct use of Cluster data nodes for data storage and retrieval. An SQL node can thus be considered a type of API node that uses a MySQL Server to provide an SQL interface to the Cluster. You can write such applications (that do not depend on a MySQL Server) using the NDB API, which supplies a direct, object-oriented transaction and scanning interface to NDB Cluster data; see [NDB Cluster API Overview: The NDB API](#), for more information.

**A.10.7** When I run the `SHOW` command in the NDB Cluster management client, I see a line of output that looks like this:

```
id=2      @10.100.10.32  (Version: 5.6.42-ndb-7.4.23 Nodegroup: 0, *)
```

What does the `*` mean? How is this node different from the others?

The simplest answer is, “It’s not something you can control, and it’s nothing that you need to worry about in any case, unless you’re a software engineer writing or analyzing the NDB Cluster source code”.

If you don’t find that answer satisfactory, here’s a longer and more technical version:

A number of mechanisms in NDB Cluster require distributed coordination among the data nodes. These distributed algorithms and protocols include global checkpointing, DDL (schema) changes, and node restart handling. To make this coordination simpler, the data nodes “elect” one of their number to act as leader. (This node was once referred to as a “master”, but this terminology was dropped to avoid confusion with master server in MySQL Replication.) There is no user-facing mechanism for influencing this selection, which is completely automatic; the fact that it *is* automatic is a key part of NDB Cluster’s internal architecture.

When a node acts as the “leader” for any of these mechanisms, it is usually the point of coordination for the activity, and the other nodes act as “followers”, carrying out their parts of the activity as directed by the leader. If the node acting as leader fails, then the remaining nodes elect a new leader. Tasks in progress that were being coordinated by the old leader may either fail or be continued by the new leader, depending on the actual mechanism involved.

It is possible for some of these different mechanisms and protocols to have different leader nodes, but in general the same leader is chosen for all of them. The node indicated as the leader in the output of `SHOW` in the management client is known internally as the `DICT` manager (see [The DBDICT Block](#), in the *NDB Cluster API Developer Guide*, for more information), responsible for coordinating DDL and metadata activity.

NDB Cluster is designed in such a way that the choice of leader has no discernible effect outside the cluster itself. For example, the current leader does not have significantly higher CPU or resource usage than the other data nodes, and failure of the leader should not have a significantly different impact on the cluster than the failure of any other data node.

**A.10.8** With which operating systems can I use NDB Cluster?

NDB Cluster is supported on most Unix-like operating systems. NDB Cluster is also supported in production settings on Microsoft Windows operating systems.

For more detailed information concerning the level of support which is offered for NDB Cluster on various operating system versions, operating system distributions, and hardware platforms, please refer to <https://www.mysql.com/support/supportedplatforms/cluster.html>.

**A.10.9** What are the hardware requirements for running NDB Cluster?

NDB Cluster should run on any platform for which [NDB-enabled binaries](#) are available. For data nodes and API nodes, faster CPUs and more memory are likely to improve performance, and 64-bit CPUs are likely to be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). For a computer which is used only for running the NDB Cluster management server, the requirements are minimal; a common desktop PC (or the equivalent) is generally sufficient for this task. Nodes can communicate through the standard TCP/IP network and hardware. They can also use the high-speed SCI protocol; however, special networking hardware and software are required to use SCI (see [Section 21.3.4, “Using High-Speed Interconnects with NDB Cluster”](#)).

**A.10.10** How much RAM do I need to use NDB Cluster? Is it possible to use disk memory at all?

NDB Cluster was originally implemented as in-memory only, but all versions currently available also provide the ability to store NDB Cluster on disk. See [Section 21.5.13, “NDB Cluster Disk Data Tables”](#), for more information.

For in-memory [NDB](#) tables, you can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 11.8, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an [NDBCLUSTER](#) table requires 21–25 bytes per record. These indexes use [IndexMemory](#).
- Each ordered index requires 10 bytes storage per record, using [DataMemory](#).
- Creating a primary key or unique index also creates an ordered index, unless this index is created with [USING HASH](#). In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with [USING HASH](#), then it requires only 21 to 25 bytes per record.

Creating NDB Cluster tables with [USING HASH](#) for all primary keys and unique indexes will generally cause table updates to run more quickly—in some cases by as much as 20 to 30 percent faster than updates on tables where [USING HASH](#) was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the [ndb\\_size.pl](#) utility which is available in recent MySQL 5.7 releases. This Perl script connects to a current (non-Cluster) MySQL database and creates a report on how much space that database would require if it used the [NDBCLUSTER](#) storage engine. For more information, see [Section 21.4.29, “ndb\\_size.pl — NDBCLUSTER Size Requirement Estimator”](#).

It is especially important to keep in mind that *every NDB Cluster table must have a primary key*. The [NDB](#) storage engine creates a primary key automatically if none is defined; this primary key is created without [USING HASH](#).

You can determine how much memory is being used for storage of NDB Cluster data and indexes at any given time using the `REPORT MEMORYUSAGE` command in the `ndb_mgm` client; see [Section 21.5.2, “Commands in the NDB Cluster Management Client”](#), for more information. In addition, warnings are written to the cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when usage reaches 85%, 90%, and so on.

**A.10.11** What file systems can I use with NDB Cluster? What about network file systems or network shares?

Generally, any file system that is native to the host operating system should work well with NDB Cluster. If you find that a given file system works particularly well (or not so especially well) with NDB Cluster, we invite you to discuss your findings in the [NDB Cluster Forums](#).

For Windows, we recommend that you use `NTFS` file systems for NDB Cluster, just as we do for standard MySQL. We do not test NDB Cluster with `FAT` or `VFAT` file systems. Because of this, we do not recommend their use with MySQL or NDB Cluster.

NDB Cluster is implemented as a shared-nothing solution; the idea behind this is that the failure of a single piece of hardware should not cause the failure of multiple cluster nodes, or possibly even the failure of the cluster as a whole. For this reason, the use of network shares or network file systems is not supported for NDB Cluster. This also applies to shared storage devices such as SANs.

**A.10.12** Can I run NDB Cluster nodes inside virtual machines (such as those created by VMWare, Parallels, or Xen)?

NDB Cluster is supported for use in virtual machines. We currently support and test using [Oracle VM](#).

Some NDB Cluster users have successfully deployed NDB Cluster using other virtualization products; in such cases, Oracle can provide NDB Cluster support, but issues specific to the virtual environment must be referred to that product's vendor.

**A.10.13** I am trying to populate an NDB Cluster database. The loading process terminates prematurely and I get an error message like this one:

```
ERROR 1114: The table 'my_cluster_table' is full
```

Why is this happening?

The cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the NDB storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, since no data node in a cluster can use more memory than the least amount available to any individual data node. For example, if there are four computers hosting Cluster data nodes, and three of these have 3GB of RAM available to store Cluster data while the remaining data node has only 1GB RAM, then each data node can devote at most 1GB to NDB Cluster data and indexes.

In some cases it is possible to get `Table is full` errors in MySQL client applications even when `ndb_mgm -e "ALL REPORT MEMORYUSAGE"` shows significant free `DataMemory`. You can force NDB to create extra partitions for NDB Cluster tables and thus have more memory available for hash indexes by using the `MAX_ROWS` option for `CREATE TABLE`. In general, setting `MAX_ROWS` to twice the number of rows that you expect to store in the table should be sufficient.

For similar reasons, you can also sometimes encounter problems with data node restarts on nodes that are heavily loaded with data. The `MinFreePct` parameter can help with this issue by

reserving a portion (5% by default) of [DataMemory](#) and [IndexMemory](#) for use in restarts. This reserved memory is not available for storing [NDB](#) tables or data.

**A.10.14** NDB Cluster uses TCP/IP. Does this mean that I can run it over the Internet, with one or more nodes in remote locations?

It is *very* unlikely that a cluster would perform reliably under such conditions, as NDB Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet—preferably the latter. We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in an NDB Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.) For more information, see [Section 21.5.12, “NDB Cluster Security Issues”](#).

**A.10.15** Do I have to learn a new programming or query language to use NDB Cluster?

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL statements are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes

Some specialized configuration parameters and files are required to set up an NDB Cluster—see [Section 21.3.3, “NDB Cluster Configuration Files”](#), for information about these.

A few simple commands are used in the NDB Cluster management client ([ndb\\_mgm](#)) for tasks such as starting and stopping cluster nodes. See [Section 21.5.2, “Commands in the NDB Cluster Management Client”](#).

**A.10.16** What programming languages and APIs are supported by NDB Cluster?

NDB Cluster supports the same programming APIs and languages as the standard MySQL Server, including ODBC, .Net, the MySQL C API, and numerous drivers for popular scripting languages such as PHP, Perl, and Python. NDB Cluster applications written using these APIs behave similarly to other MySQL applications; they transmit SQL statements to a MySQL Server (in the case of NDB Cluster, an SQL node), and receive responses containing rows of data. For more information about these APIs, see [Chapter 27, Connectors and APIs](#).

NDB Cluster also supports application programming using the NDB API, which provides a low-level C++ interface to NDB Cluster data without needing to go through a MySQL Server. See [The NDB API](#). In addition, many [NDBCLUSTER](#) management functions are exposed by the C-language MGM API; see [The MGM API](#), for more information.

NDB Cluster also supports Java application programming using ClusterJ, which supports a domain object model of data using sessions and transactions. See [Java and NDB Cluster](#), for more information.

In addition, NDB Cluster provides support for [memcached](#), allowing developers to access data stored in NDB Cluster using the [memcached](#) interface; for more information, see [ndbmemcache —Memcache API for NDB Cluster](#).

NDB Cluster 7.3 and later include adapters supporting NoSQL applications written against `Node.js`, with NDB Cluster as the data store. See [MySQL NoSQL Connector for JavaScript](#), for more information.

**A.10.17** Does NDB Cluster include any management tools?

NDB Cluster includes a command line client for performing basic management functions. See [Section 21.4.5, “`ndb\_mgm` — The NDB Cluster Management Client](#)”, and [Section 21.5.2, “Commands in the NDB Cluster Management Client](#)”.

NDB Cluster is also supported by MySQL Cluster Manager, a separate product providing an advanced command line interface that can automate many NDB Cluster management tasks such as rolling restarts and configuration changes. For more information about MySQL Cluster Manager, see [MySQL™ Cluster Manager 1.4.6 User Manual](#).

NDB Cluster (version 7.3 and later) provides a graphical, browser-based Auto-Installer for setting up and deploying NDB Cluster, as part of the NDB Cluster software distribution. For more information, see [Section 21.2.1, “The NDB Cluster Auto-Installer \(NDB 7.5\)”](#).

**A.10.18** How do I find out what an error or warning message means when using NDB Cluster?

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition.
- From a system shell prompt, use `pererror --ndb error_code`.

**A.10.19** Is NDB Cluster transaction-safe? What isolation levels are supported?

Yes. For tables created with the `NDB` storage engine, transactions are supported. Currently, NDB Cluster supports only the `READ COMMITTED` transaction isolation level.

**A.10.20** What storage engines are supported by NDB Cluster?

Clustering with MySQL is supported only by the `NDB` storage engine. That is, in order for a table to be shared between nodes in an NDB Cluster, the table must be created using `ENGINE=NDB` (or the equivalent option `ENGINE=NDBCLUSTER`).

It is possible to create tables using other storage engines (such as `InnoDB` or `MyISAM`) on a MySQL server being used with an NDB Cluster, but since these tables do not use `NDB`, they do not participate in clustering; each such table is strictly local to the individual MySQL server instance on which it is created.

**A.10.21** In the event of a catastrophic failure—for example, the whole city loses power *and* my UPS fails—would I lose all my data?

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

**A.10.22** Is it possible to use `FULLTEXT` indexes with NDB Cluster?

`FULLTEXT` indexing is currently supported only by the `InnoDB` and `MyISAM` storage engines. See [Section 12.9, “Full-Text Search Functions](#)”, for more information.

**A.10.23** Can I run multiple nodes on a single computer?

It is possible but not always advisable. One of the chief reasons to run a cluster is to provide redundancy. To obtain the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you

lose all of those nodes. For this reason, if you do run multiple data nodes on a single machine, it is *extremely* important that they be set up in such a way that the failure of this machine does not cause the loss of all the data nodes in a given node group.

Given that NDB Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 300 MHz Pentium or equivalent CPU and sufficient RAM for the operating system, plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host that has multiple CPUs, cores, or both. The NDB Cluster distribution also provides a multithreaded version of the data node binary intended for use on such systems. For more information, see [Section 21.4.3, “`ndbmt\_d` — The NDB Cluster Data Node Daemon \(Multi-Threaded\)](#)”.

It is also possible in some cases to run data nodes and SQL nodes concurrently on the same machine; how well such an arrangement performs is dependent on a number of factors such as number of cores and CPUs as well as the amount of disk and memory available to the data node and SQL node processes, and you must take these factors into account when planning such a configuration.

#### **A.10.24** Can I add data nodes to an NDB Cluster without restarting it?

It is possible to add new data nodes to a running NDB Cluster without taking the cluster offline. For more information, see [Section 21.5.14, “Adding NDB Cluster Data Nodes Online](#)”.

For other types of NDB Cluster nodes, a rolling restart is all that is required (see [Section 21.5.5, “Performing a Rolling Restart of an NDB Cluster](#)”).

#### **A.10.25** Are there any limitations that I should be aware of when using NDB Cluster?

Limitations on `NDB` tables in MySQL NDB Cluster 7.3 and later include the following:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- The only types of user-defined partitioning supported for `NDBCLUSTER` tables are `KEY` and `LINEAR KEY`. Trying to create an `NDB` table using any other partitioning type fails with an error.
- `FULLTEXT` indexes are not supported.
- Index prefixes are not supported. Only complete columns may be indexed.
- Spatial indexes are not supported (although spatial columns can be used). See [Section 11.5, “Spatial Data Types](#)”.
- Support for partial transactions and partial rollbacks is comparable to that of other transactional storage engines such as `InnoDB` that can roll back individual statements.
- The maximum number of attributes allowed per table is 512. Attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 14 kilobytes, not counting `BLOB` values.

There is no set limit for the number of rows per `NDB` table. Limits on table size depend on a number of factors, in particular on the amount of RAM available to each data node.

For a complete listing of limitations in NDB Cluster, see [Section 21.1.6, “Known Limitations of NDB Cluster”](#). See also [Previous NDB Cluster Issues Resolved in NDB Cluster 7.3](#).

**A.10.26** Does NDB Cluster support foreign keys?

NDB Cluster 7.3 and later provide support for foreign key constraints, comparable to that found in the [InnoDB](#) storage engine; see [Section 1.8.3.2, “FOREIGN KEY Constraints”](#), for more detailed information, as well as [Section 13.1.18.6, “Using FOREIGN KEY Constraints”](#). Applications requiring foreign key support should use NDB Cluster 7.3, 7.4, 7.5, or later.

**A.10.27** How do I import an existing MySQL database into an NDB Cluster?

You can import databases into NDB Cluster much as you would with any other version of MySQL. Other than the limitations mentioned elsewhere in this FAQ, the only other special requirement is that any tables to be included in the cluster must use the [NDB](#) storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`.

It is also possible to convert existing tables that use other storage engines to [NDBCLUSTER](#) using one or more `ALTER TABLE` statement. However, the definition of the table must be compatible with the [NDBCLUSTER](#) storage engine prior to making the conversion. In MySQL 5.7, an additional workaround is also required; see [Section 21.1.6, “Known Limitations of NDB Cluster”](#), for details.

**A.10.28** How do NDB Cluster nodes communicate with one another?

Cluster nodes can communicate through any of three different transport mechanisms: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host; however, this is considered experimental. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 21.3.4, “Using High-Speed Interconnects with NDB Cluster”](#), for more about using SCI as a transport mechanism for NDB Cluster.

**A.10.29** What is an *arbitrator*?

If one or more data nodes in a cluster fail, it is possible that not all cluster data nodes will be able to “see” one another. In fact, it is possible that two sets of data nodes might become isolated from one another in a network partitioning, also known as a “split-brain” scenario. This type of situation is undesirable because each set of data nodes tries to behave as though it is the entire cluster. An arbitrator is required to decide between the competing sets of data nodes.

When all data nodes in at least one node group are alive, network partitioning is not an issue, because no single subset of the cluster can form a functional cluster on its own. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the [ArbitrationRank](#) configuration parameter for MySQL Server and management server nodes. You can also use the [ArbitrationRank](#) configuration parameter to control the arbitrator selection process. For more information about these parameters, see [Section 21.3.3.5, “Defining an NDB Cluster Management Server”](#).

The role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

**A.10.30** What data types are supported by NDB Cluster?

NDB Cluster supports all of the usual MySQL data types, including those associated with MySQL's spatial extensions; however, the NDB storage engine does not support spatial indexes. (Spatial indexes are supported only by [MyISAM](#); see [Section 11.5, “Spatial Data Types”](#), for more information.) In addition, there are some differences with regard to indexes when used with NDB tables.

#### Note

NDB Cluster Disk Data tables (that is, tables created with `TABLESPACE ... STORAGE DISK ENGINE=NDB` or `TABLESPACE ... STORAGE DISK ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each Disk Data table record containing a `VARCHAR(255)` column requires space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein.

See [Section 21.1.6, “Known Limitations of NDB Cluster”](#), for more information about these issues.

### A.10.3 How do I start and stop NDB Cluster?

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node, using the `ndb_mgmd` command.

You must include the `-f` or `--config-file` option to tell the management node where its configuration file can be found.

2. Start each data node with the `ndbd` command.

Each data node must be started with the `-c` or `--ndb-connectstring` option so that the data node knows how to connect to the management server.

3. Start each MySQL Server (SQL node) using your preferred startup script, such as `mysqld_safe`.

Each MySQL Server must be started with the `--ndbcluster` and `--ndb-connectstring` options. These options cause `mysqld` to enable `NDBCLUSTER` storage engine support and how to connect to the management server.

Each of these commands must be run from a system shell on the machine housing the affected node. (You do not have to be physically present at the machine—a remote login shell can be used for this purpose.) You can verify that the cluster is running by starting the NDB management client `ndb_mgm` on the machine housing the management node and issuing the `SHOW` or `ALL STATUS` command.

To shut down a running cluster, issue the command `SHUTDOWN` in the management client. Alternatively, you may enter the following command in a system shell:

```
shell> ndb_mgm -e "SHUTDOWN"
```

(The quotation marks in this example are optional, since there are no spaces in the command string following the `-e` option; in addition, the `SHUTDOWN` command, like other management client commands, is not case-sensitive.)

Either of these commands causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 21.5.2, “Commands in the NDB Cluster Management Client”](#), and [Section 21.2.8, “Safe Shutdown and Restart of NDB Cluster”](#).

**A.10.32** What happens to NDB Cluster data when the NDB Cluster is shut down?

The data that was held in memory by the cluster's data nodes is written to disk, and is reloaded into memory the next time that the cluster is started.

**A.10.33** Is it a good idea to have more than one management node for an NDB Cluster?

It can be helpful as a fail-safe. Only one management node controls the cluster at any given time, but it is possible to configure one management node as primary, and one or more additional management nodes to take over in the event that the primary management node fails.

See [Section 21.3.3, “NDB Cluster Configuration Files”](#), for information on how to configure NDB Cluster management nodes.

**A.10.34** Can I mix different kinds of hardware and operating systems in one NDB Cluster?

Yes, as long as all machines and operating systems have the same “endianness” (all big-endian or all little-endian).

It is also possible to use software from different NDB Cluster releases on different nodes. However, we support this only as part of a rolling upgrade procedure (see [Section 21.5.5, “Performing a Rolling Restart of an NDB Cluster”](#)).

**A.10.35** Can I run two data nodes on a single host? Two SQL nodes?

Yes, it is possible to do this. In the case of multiple data nodes, it is advisable (but not required) for each node to use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port.

Running data nodes and SQL nodes together on the same host is possible, but you should be aware that the `ndbd` (or `ndbmt`) and `mysqld` processes may compete for memory.

**A.10.36** Can I use host names with NDB Cluster?

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, you should use fixed (numeric) IP addresses, since making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional potential points of failure.

**A.10.37** Does NDB Cluster support IPv6?

IPv6 is supported for connections between SQL nodes (MySQL servers), but connections between all other types of NDB Cluster nodes must use IPv4.

In practical terms, this means that you can use IPv6 for replication between NDB Clusters, but connections between nodes in the same NDB Cluster must use IPv4. For more information, see [Section 21.6.3, “Known Issues in NDB Cluster Replication”](#).

**A.10.38** How do I handle MySQL users in an NDB Cluster having multiple MySQL servers?

MySQL user accounts and privileges are normally not automatically propagated between different MySQL servers accessing the same NDB Cluster. MySQL NDB Cluster provides support for distributed privileges, which you can enable by following a procedure provided in the documentation; see [Section 21.5.15, “Distributed MySQL Privileges for NDB Cluster”](#), for more information.

**A.10.39** How do I continue to send queries in the event that one of the SQL nodes fails?

MySQL NDB Cluster does not provide any sort of automatic failover between SQL nodes. Your application must be prepared to handle the loss of SQL nodes and to fail over between them.

**A.10.40** How do I back up and restore an NDB Cluster?

You can use the NDB Cluster native backup and restore functionality in the NDB management client and the `ndb_restore` program. See [Section 21.5.3, “Online Backup of NDB Cluster”](#), and [Section 21.4.24, “ndb\\_restore — Restore an NDB Cluster Backup”](#).

You can also use the traditional functionality provided for this purpose in `mysqldump` and the MySQL server. See [Section 4.5.4, “mysqldump — A Database Backup Program”](#), for more information.

**A.10.41** What is an “angel process”?

This process monitors and, if necessary, attempts to restart the data node process. If you check the list of active processes on your system after starting `ndbd`, you can see that there are actually 2 processes running by that name, as shown here (we omit the output from `ndb_mgmd` and `ndbd` for brevity):

```
shell> ./ndb_mgmd

shell> ps aux | grep ndb
me      23002  0.0  0.0 122948  3104 ?        Ssl  14:14   0:00 ./ndb_mgmd
me      23025  0.0  0.0   5284    820 pts/2    S+   14:14   0:00 grep ndb

shell> ./ndbd -c 127.0.0.1 --initial

shell> ps aux | grep ndb
me      23002  0.0  0.0 123080  3356 ?        Ssl  14:14   0:00 ./ndb_mgmd
me      23096  0.0  0.0   35876  2036 ?        Ss   14:14   0:00 ./ndbd -c 127.0.0.1 --initial
me      23097  1.0  2.4 524116 91096 ?        Sl   14:14   0:00 ./ndbd -c 127.0.0.1 --initial
me      23168  0.0  0.0   5284    812 pts/2    R+   14:15   0:00 grep ndb
```

The `ndbd` process showing 0 memory and CPU usage is the angel process. It actually does use a very small amount of each, of course. It simply checks to see if the main `ndbd` process (the primary data node process that actually handles the data) is running. If permitted to do so (for example, if the `StopOnError` configuration parameter is set to false—see [Section 21.3.2.1, “NDB Cluster Data Node Configuration Parameters”](#)), the angel process tries to restart the primary data node process.

## A.11 MySQL 5.7 FAQ: MySQL Chinese, Japanese, and Korean Character Sets

This set of Frequently Asked Questions derives from the experience of MySQL's Support and Development groups in handling many inquiries about CJK (Chinese-Japanese-Korean) issues.

- A.11.1 What CJK character sets are available in MySQL? ..... 4276
- A.11.2 I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters? ..... 4277
- A.11.3 What problems should I be aware of when working with the Big5 Chinese character set? .. 4279
- A.11.4 Why do Japanese character set conversions fail? ..... 4279
- A.11.5 What should I do if I want to convert SJIS 81CA to cp932? ..... 4280
- A.11.6 How does MySQL represent the Yen (¥) sign? ..... 4280
- A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL? .... 4280
- A.11.8 Why do I get `Incorrect string value` error messages? ..... 4280

#### A.11.1 What CJK character sets are available in MySQL?

The list of CJK character sets may vary depending on your MySQL version. For example, the `gb18030` character set is not supported prior to MySQL 5.7.4. However, since the name of the applicable language appears in the `DESCRIPTION` column for every entry in the `INFORMATION_SCHEMA.CHARACTER_SETS` table, you can obtain a current list of all the non-Unicode CJK character sets using this query:

```
mysql> SELECT CHARACTER_SET_NAME, DESCRIPTION
FROM INFORMATION_SCHEMA.CHARACTER_SETS
WHERE DESCRIPTION LIKE '%Chin%'
OR DESCRIPTION LIKE '%Japanese%'
OR DESCRIPTION LIKE '%Korean%'
ORDER BY CHARACTER_SET_NAME;
```

CHARACTER_SET_NAME	DESCRIPTION
big5	Big5 Traditional Chinese
cp932	SJIS for Windows Japanese
eucjpms	UJIS for Windows Japanese
euckr	EUC-KR Korean
gb18030	China National Standard GB18030
gb2312	GB2312 Simplified Chinese
gbk	GBK Simplified Chinese
sjis	Shift-JIS Japanese
ujis	EUC-JP Japanese

(For more information, see [Section 24.2, “The INFORMATION\\_SCHEMA CHARACTER\\_SETS Table”](#).)

MySQL supports three variants of the *GB* (*Guojia Biaozhun*, or *National Standard*, or *Simplified Chinese*) character sets which are official in the People's Republic of China: `gb2312`, `gbk`, and (as of MySQL 5.7.4) `gb18030`.

Sometimes people try to insert `gbk` characters into `gb2312`, and it works most of the time because `gbk` is a superset of `gb2312`. But eventually they try to insert a rarer Chinese character and it does not work. (For an example, see Bug #16072).

Here, we try to clarify exactly what characters are legitimate in `gb2312` or `gbk`, with reference to the official documents. Please check these references before reporting `gb2312` or `gbk` bugs:

- The MySQL `gbk` character set is in reality “Microsoft code page 936”. This differs from the official `gbk` for characters `A1A4` (middle dot), `A1AA` (em dash), `A6E0–A6F5`, and `A8BB–A8C0`.
- For a listing of `gbk`/Unicode mappings, see <http://www.unicode.org/Public/MAPPINGS/VENDORS/MICSFT/WINDOWS/CP936.TXT>.

It is also possible to store CJK characters in Unicode character sets, although the available collations may not sort characters quite as you expect:

- The `utf8` and `ucs2` character sets support the characters from Unicode Basic Multilingual Plane (BMP). These characters have code point values between `U+0000` and `U+FFFF`.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters that lie outside the BMP. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

The collation used for a Unicode character set determines the ability to sort (that is, distinguish) characters in the set:

- Collations based on Unicode Collation Algorithm (UCA) 4.0.0 distinguish only BMP characters.
- Collations based on UCA 5.2.0 or 9.0.0 distinguish BMP and supplementary characters.
- Non-UCA collations may not distinguish all Unicode characters. For example, the `utf8mb4` default collation is `utf8mb4_general_ci`, which distinguishes only BMP characters.

Moreover, distinguishing characters is not the same as ordering them per the conventions of a given CJK language. Currently, MySQL has only one CJK-specific UCA collation, `gb18030_unicode_520_ci` (which requires use of the non-Unicode `gb18030` character set).

For information about Unicode collations and their differentiating properties, including collation properties for supplementary characters, see [Section 10.10.1, “Unicode Character Sets”](#).

#### A.11.2I have inserted CJK characters into my table. Why does `SELECT` display them as “?” characters?

This problem is usually due to a setting in MySQL that does not match the settings for the application program or the operating system. Here are some common steps for correcting these types of issues:

- *Be certain of what MySQL version you are using.*

Use the statement `SELECT VERSION();` to determine this.

- *Make sure that the database is actually using the desired character set.*

People often think that the client character set is always the same as either the server character set or the character set used for display purposes. However, both of these are false assumptions. You can make sure by checking the result of `SHOW CREATE TABLE tablename` or, better yet, by using this statement:

```
SELECT character_set_name, collation_name
FROM information_schema.columns
WHERE table_schema = your_database_name
AND table_name = your_table_name
AND column_name = your_column_name;
```

- *Determine the hexadecimal value of the character or characters that are not being displayed correctly.*

You can obtain this information for a column `column_name` in the table `table_name` using the following query:

```
SELECT HEX(column_name)
FROM table_name;
```

`3F` is the encoding for the `?` character; this means that `?` is the character actually stored in the column. This most often happens because of a problem converting a particular character from your client character set to the target character set.

- *Make sure that a round trip is possible. When you select `literal` (or `_introducer hexadecimal-value`), do you obtain `literal` as a result?*

For example, the Japanese Katakana character *Pe* (ペ) exists in all CJK character sets, and has the code point value (hexadecimal coding) `0x30da`. To test a round trip for this character, use this query:

```
SELECT 'ペ' AS `ペ`;          /* or SELECT _ucs2 0x30da; */
```

If the result is not also ペ, the round trip failed.

For bug reports regarding such failures, we might ask you to follow up with `SELECT HEX('ペ');`. Then we can determine whether the client encoding is correct.

- *Make sure that the problem is not with the browser or other application, rather than with MySQL.*

Use the `mysql` client program to accomplish this task. If `mysql` displays characters correctly but your application does not, your problem is probably due to system settings.

To determine your settings, use the `SHOW VARIABLES` statement, whose output should resemble what is shown here:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	utf8
character_set_connection	utf8
character_set_database	latin1
character_set_filesystem	binary
character_set_results	utf8
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

These are typical character-set settings for an international-oriented client (notice the use of `utf8` Unicode) connected to a server in the West (`latin1` is a West Europe character set).

Although Unicode (usually the `utf8` variant on Unix, and the `ucs2` variant on Windows) is preferable to Latin, it is often not what your operating system utilities support best. Many Windows users find that a Microsoft character set, such as `cp932` for Japanese Windows, is suitable.

If you cannot control the server settings, and you have no idea what setting your underlying computer uses, try changing to a common character set for the country that you're in (`euckr` = Korea; `gb18030`, `gb2312` or `gbk` = People's Republic of China; `big5` = Taiwan; `sjis`, `ujis`, `cp932`, or `eucjpms` = Japan; `ucs2` or `utf8` = anywhere). Usually it is necessary to change only the client and connection and results settings. The `SET NAMES` statement changes all three at once. For example:

```
SET NAMES 'big5';
```

Once the setting is correct, you can make it permanent by editing `my.cnf` or `my.ini`. For example you might add lines looking like these:

```
[mysqld]
character-set-server=big5
[client]
default-character-set=big5
```

It is also possible that there are issues with the API configuration setting being used in your application; see *Why does my GUI front end or browser not display CJK characters correctly...?* for more information.

#### A.11.3 What problems should I be aware of when working with the Big5 Chinese character set?

MySQL supports the Big5 character set which is common in Hong Kong and Taiwan (Republic of China). The MySQL `big5` character set is in reality Microsoft code page 950, which is very similar to the original `big5` character set.

A feature request for adding `HKSCS` extensions has been filed. People who need this extension may find the suggested patch for Bug #13577 to be of interest.

#### A.11.4 Why do Japanese character set conversions fail?

MySQL supports the `sjis`, `ujis`, `cp932`, and `eucjpms` character sets, as well as Unicode. A common need is to convert between character sets. For example, there might be a Unix server (typically with `sjis` or `ujis`) and a Windows client (typically with `cp932`).

In the following conversion table, the `ucs2` column represents the source, and the `sjis`, `cp932`, `ujis`, and `eucjpms` columns represent the destinations; that is, the last 4 columns provide the hexadecimal result when we use `CONVERT(ucs2)` or we assign a `ucs2` column containing the value to an `sjis`, `cp932`, `ujis`, or `eucjpms` column.

Character Name	ucs2	sjis	cp932	ujis	eucjpms
BROKEN BAR	00A6	3F	3F	8FA2C3	3F
FULLWIDTH BROKEN BAR	FFE4	3F	FA55	3F	8FA2
YEN SIGN	00A5	3F	3F	20	3F
FULLWIDTH YEN SIGN	FFE5	818F	818F	A1EF	3F
TILDE	007E	7E	7E	7E	7E
OVERLINE	203E	3F	3F	20	3F
HORIZONTAL BAR	2015	815C	815C	A1BD	A1BD
EM DASH	2014	3F	3F	3F	3F
REVERSE SOLIDUS	005C	815F	5C	5C	5C
FULLWIDTH ""	FF3C	3F	815F	3F	A1C0
WAVE DASH	301C	8160	3F	A1C1	3F
FULLWIDTH TILDE	FF5E	3F	8160	3F	A1C1
DOUBLE VERTICAL LINE	2016	8161	3F	A1C2	3F
PARALLEL TO	2225	3F	8161	3F	A1C2
MINUS SIGN	2212	817C	3F	A1DD	3F
FULLWIDTH HYPHEN-MINUS	FF0D	3F	817C	3F	A1DD
CENT SIGN	00A2	8191	3F	A1F1	3F
FULLWIDTH CENT SIGN	FFE0	3F	8191	3F	A1F1
POUND SIGN	00A3	8192	3F	A1F2	3F
FULLWIDTH POUND SIGN	FFE1	3F	8192	3F	A1F2
NOT SIGN	00AC	81CA	3F	A2CC	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA	3F	A2CC

Now consider the following portion of the table.

	ucs2	sjis	cp932
NOT SIGN	00AC	81CA	3F
FULLWIDTH NOT SIGN	FFE2	3F	81CA

This means that MySQL converts the `NOT SIGN` (Unicode `U+00AC`) to `sjis` code point `0x81CA` and to `cp932` code point `3F`. (`3F` is the question mark “?”). This is what is always used when the conversion cannot be performed.)

#### A.11.5 What should I do if I want to convert SJIS `81CA` to `cp932`?

Our answer is: “?”. There are disadvantages to this, and many people would prefer a “loose” conversion, so that `81CA` (`NOT SIGN`) in `sjis` becomes `81CA` (`FULLWIDTH NOT SIGN`) in `cp932`.

#### A.11.6 How does MySQL represent the Yen (¥) sign?

A problem arises because some versions of Japanese character sets (both `sjis` and `eur`) treat `5C` as a *reverse solidus* (`\`, also known as a backslash), whereas others treat it as a yen sign (¥).

MySQL follows only one version of the JIS (Japanese Industrial Standards) standard description. In MySQL, `5C` is *always the reverse solidus* (`\`).

#### A.11.7 Of what issues should I be aware when working with Korean character sets in MySQL?

In theory, while there have been several versions of the `euclkr` (*Extended Unix Code Korea*) character set, only one problem has been noted. We use the “ASCII” variant of EUC-KR, in which the code point `0x5C` is REVERSE SOLIDUS, that is `\`, instead of the “KS-Roman” variant of EUC-KR, in which the code point `0x5C` is `WON SIGN` (₩). This means that you cannot convert Unicode `U+20A9` to `euclkr`:

```
mysql> SELECT
        CONVERT('₩' USING euclkr) AS euclkr,
        HEX(CONVERT('₩' USING euclkr)) AS hexeuclkr;
+-----+-----+
| euclkr | hexeuclkr |
+-----+-----+
| ?      | 3F         |
+-----+-----+
```

#### A.11.8 Why do I get `Incorrect string value` error messages?

To see the problem, create a table with one Unicode (`ucs2`) column and one Chinese (`gb2312`) column.

```
mysql> CREATE TABLE ch
        (ucs2 CHAR(3) CHARACTER SET ucs2,
         gb2312 CHAR(3) CHARACTER SET gb2312);
```

In nonstrict SQL mode, try to place the rare character ㄖ in both columns.

```
mysql> SET sql_mode = '';
mysql> INSERT INTO ch VALUES ('AㄖB','AㄖB');
Query OK, 1 row affected, 1 warning (0.00 sec)
```

The `INSERT` produces a warning. Use the following statement to see what it is:

```
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
```

```
Code: 1366
Message: Incorrect string value: '\xE6\xB1\x8CB' for column 'gb2312' at row 1
```

So it is a warning about the `gb2312` column only.

```
mysql> SELECT ucs2,HEX(ucs2),gb2312,HEX(gb2312) FROM ch;
+-----+-----+-----+-----+
| ucs2  | HEX(ucs2) | gb2312 | HEX(gb2312) |
+-----+-----+-----+-----+
| A㄀B  | 00416C4C0042 | A?B    | 413F42      |
+-----+-----+-----+-----+
```

Several things need explanation here:

1. The `㄀` character is not in the `gb2312` character set, as described earlier.
2. If you are using an old version of MySQL, you may see a different message.
3. A warning occurs rather than an error because MySQL is not set to use strict SQL mode. In nonstrict mode, MySQL tries to do what it can, to get the best fit, rather than give up. With strict SQL mode, the `Incorrect string value` message occurs as an error rather than a warning, and the `INSERT` fails.

#### A.11.9 Why does my GUI front end or browser display CJK characters incorrectly in my application using Access, PHP, or another API?

Obtain a direct connection to the server using the `mysql` client, and try the same query there. If `mysql` responds correctly, the trouble may be that your application interface requires initialization. Use `mysql` to tell you what character set or sets it uses with the statement `SHOW VARIABLES LIKE 'char%';`. If you are using Access, you are most likely connecting with Connector/ODBC. In this case, you should check [Configuring Connector/ODBC](#). If, for example, you use `big5`, you would enter `SET NAMES 'big5'`. (In this case, no `;` character is required.) If you are using ASP, you might need to add `SET NAMES` in the code. Here is an example that has worked in the past:

```
<%
Session.CodePage=0
Dim strConnection
Dim Conn
strConnection="driver={MySQL ODBC 3.51 Driver};server=server;uid=username;" \
& "pwd=password;database=database;stmt=SET NAMES 'big5';"
Set Conn = Server.CreateObject("ADODB.Connection")
Conn.Open strConnection
%>
```

In much the same way, if you are using any character set other than `latin1` with Connector/NET, you must specify the character set in the connection string. See [Connecting to MySQL Using Connector/NET](#), for more information.

If you are using PHP, try this:

```
<?php
$link = new mysqli($host, $usr, $pwd, $db);

if( mysqli_connect_errno() )
{
    printf("Connect failed: %s\n", mysqli_connect_error());
    exit();
}

$link->query("SET NAMES 'utf8'");
?>
```

In this case, we used `SET NAMES` to change `character_set_client`, `character_set_connection`, and `character_set_results`.

Another issue often encountered in PHP applications has to do with assumptions made by the browser. Sometimes adding or changing a `<meta>` tag suffices to correct the problem: for example, to insure that the user agent interprets page content as UTF-8, include `<meta http-equiv="Content-Type" content="text/html; charset=utf-8">` in the `<head>` section of the HTML page.

If you are using Connector/J, see [Using Character Sets and Unicode](#).

**A.11.10** I've upgraded to MySQL 5.7. How can I revert to behavior like that in MySQL 4.0 with regard to character sets?

In MySQL Version 4.0, there was a single “global” character set for both server and client, and the decision as to which character to use was made by the server administrator. This changed starting with MySQL Version 4.1. What happens now is a “handshake”, as described in [Section 10.4, “Connection Character Sets and Collations”](#):

When a client connects, it sends to the server the name of the character set that it wants to use. The server uses the name to set the `character_set_client`, `character_set_results`, and `character_set_connection` system variables. In effect, the server performs a `SET NAMES` operation using the character set name.

The effect of this is that you cannot control the client character set by starting `mysqld` with `--character-set-server=utf8`. However, some Asian customers prefer the MySQL 4.0 behavior. To make it possible to retain this behavior, we added a `mysqld` switch, `--character-set-client-handshake`, which can be turned off with `--skip-character-set-client-handshake`. If you start `mysqld` with `--skip-character-set-client-handshake`, then, when a client connects, it sends to the server the name of the character set that it wants to use. However, *the server ignores this request from the client*.

By way of example, suppose that your favorite server character set is `latin1` (unlikely in a CJK area, but this is the default value). Suppose further that the client uses `utf8` because this is what the client's operating system supports. Now, start the server with `latin1` as its default character set:

```
mysqld --character-set-server=latin1
```

And then start the client with the default character set `utf8`:

```
mysql --default-character-set=utf8
```

The resulting settings can be seen by viewing the output of `SHOW VARIABLES`:

```
mysql> SHOW VARIABLES LIKE 'char%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_client | utf8 |
| character_set_connection | utf8 |
| character_set_database | latin1 |
| character_set_filesystem | binary |
| character_set_results | utf8 |
| character_set_server | latin1 |
| character_set_system | utf8 |
| character_sets_dir | /usr/local/mysql/share/mysql/charsets/ |
+-----+-----+
```

Now stop the client, and stop the server using `mysqladmin`. Then start the server again, but this time tell it to skip the handshake like so:

```
mysqld --character-set-server=utf8 --skip-character-set-client-handshake
```

Start the client with `utf8` once again as the default character set, then display the resulting settings:

```
mysql> SHOW VARIABLES LIKE 'char%';
```

Variable_name	Value
character_set_client	latin1
character_set_connection	latin1
character_set_database	latin1
character_set_filesystem	binary
character_set_results	latin1
character_set_server	latin1
character_set_system	utf8
character_sets_dir	/usr/local/mysql/share/mysqlCharsets/

As you can see by comparing the differing results from `SHOW VARIABLES`, the server ignores the client's initial settings if the `--skip-character-set-client-handshake` option is used.

#### A.11.1 Why do some `LIKE` and `FULLTEXT` searches with CJK characters fail?

For `LIKE` searches, there is a very simple problem with binary string column types such as `BINARY` and `BLOB`: we must know where characters end. With multibyte character sets, different characters might have different octet lengths. For example, in `utf8`, `A` requires one byte but `ㄹ` requires three bytes, as shown here:

OCTET_LENGTH(utf8 'A')	OCTET_LENGTH(utf8 'ㄹ')
1	3

If we do not know where the first character in a string ends, we do not know where the second character begins, in which case even very simple searches such as `LIKE '_A%'` fail. The solution is to use a nonbinary string column type defined to have the proper CJK character set. For example: `mycol TEXT CHARACTER SET sjis`. Alternatively, convert to a CJK character set before comparing.

This is one reason why MySQL cannot permit encodings of nonexistent characters. If it is not strict about rejecting bad input, it has no way of knowing where characters end.

For `FULLTEXT` searches, we must know where words begin and end. With Western languages, this is rarely a problem because most (if not all) of these use an easy-to-identify word boundary: the space character. However, this is not usually the case with Asian writing. We could use arbitrary halfway measures, like assuming that all Han characters represent words, or (for Japanese) depending on changes from Katakana to Hiragana due to grammatical endings. However, the only sure solution requires a comprehensive word list, which means that we would have to include a dictionary in the server for each Asian language supported. This is simply not feasible.

#### A.11.2 How do I know whether character `x` is available in all character sets?

The majority of simplified Chinese and basic nonhalfwidth Japanese Kana characters appear in all CJK character sets. The following stored procedure accepts a `UCS-2` Unicode character, converts it to other character sets, and displays the results in hexadecimal.

```

DELIMITER //

CREATE PROCEDURE p_convert(ucs2_char CHAR(1) CHARACTER SET ucs2)
BEGIN

CREATE TABLE tj
    (ucs2 CHAR(1) character set ucs2,
     utf8 CHAR(1) character set utf8,
     big5 CHAR(1) character set big5,
     cp932 CHAR(1) character set cp932,
     eucjpms CHAR(1) character set eucjpms,
     euckr CHAR(1) character set euckr,
     gb2312 CHAR(1) character set gb2312,
     gbk CHAR(1) character set gbk,
     sjis CHAR(1) character set sjis,
     ujis CHAR(1) character set ujis);

INSERT INTO tj (ucs2) VALUES (ucs2_char);

UPDATE tj SET utf8=ucs2,
             big5=ucs2,
             cp932=ucs2,
             eucjpms=ucs2,
             euckr=ucs2,
             gb2312=ucs2,
             gbk=ucs2,
             sjis=ucs2,
             ujis=ucs2;

/* If there are conversion problems, UPDATE produces warnings. */

SELECT hex(ucs2) AS ucs2,
       hex(utf8) AS utf8,
       hex(big5) AS big5,
       hex(cp932) AS cp932,
       hex(eucjpms) AS eucjpms,
       hex(euckr) AS euckr,
       hex(gb2312) AS gb2312,
       hex(gbk) AS gbk,
       hex(sjis) AS sjis,
       hex(ujis) AS ujis
FROM tj;

DROP TABLE tj;

END//

DELIMITER ;

```

The input can be any single `ucs2` character, or it can be the code value (hexadecimal representation) of that character. For example, from Unicode's list of `ucs2` encodings and names (<http://www.unicode.org/Public/UNIDATA/UnicodeData.txt>), we know that the Katakana character *Pe* appears in all CJK character sets, and that its code value is `X'30DA'`. If we use this value as the argument to `p_convert()`, the result is as shown here:

```

mysql> CALL p_convert(X'30DA');
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| ucs2 | utf8 | big5 | cp932 | eucjpms | euckr | gb2312 | gbk | sjis | ujis |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+
| 30DA | E3839A | C772 | 8379 | A5DA | ABDA | A5DA | A5DA | 8379 | A5DA |
+-----+-----+-----+-----+-----+-----+-----+-----+-----+

```

Since none of the column values is `3F` (that is, the question mark character, `?`), we know that every conversion worked.

#### A.11.13 Why do CJK strings sort incorrectly in Unicode? (I)

**Note**

The CJK sorting problems described here can occur for MySQL versions prior to MySQL 8.0. As of MySQL 8.0, they can be solved by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

Sometimes people observe that the result of a `utf8_unicode_ci` or `ucs2_unicode_ci` search, or of an `ORDER BY` sort is not what they think a native would expect. Although we never rule out the possibility that there is a bug, we have found in the past that many people do not correctly read the standard table of weights for the Unicode Collation Algorithm. MySQL uses the tables found under <http://www.unicode.org/Public/UCA/>:

- UCA 4.0.0 table: <http://www.unicode.org/Public/UCA/4.0.0/allkeys-4.0.0.txt>

This includes `xxx_unicode_ci` collations with no version number in the collation name.

- UCA 5.2.0 table: <http://www.unicode.org/Public/UCA/5.2.0/allkeys.txt>

This includes collations with `_520_` in the collation name.

- UCA 9.0.0 table: <http://www.unicode.org/Public/UCA/9.0.0/allkeys.txt>

This includes collations with `_0900_` in the collation name.

To handle newer UCA versions, we create new collations. We are very wary about changing ordering of existing collations because that affects indexes, which can bring about situations such as that reported in Bug #16526, illustrated as follows:

```
mysql> CREATE TABLE tj (s1 CHAR(1) CHARACTER SET utf8 COLLATE utf8_unicode_ci);
Query OK, 0 rows affected (0.05 sec)

mysql> INSERT INTO tj VALUES ('が'),('か');
Query OK, 2 rows affected (0.00 sec)
Records: 2  Duplicates: 0  Warnings: 0

mysql> SELECT * FROM tj WHERE s1 = 'か';
+-----+
| s1    |
+-----+
| が    |
| か    |
+-----+
```

The character in the first result row is not the one that we searched for. Why did MySQL retrieve it? First we look for the Unicode code point value, which is possible by reading the hexadecimal number for the `ucs2` version of the characters:

```
mysql> SELECT s1, HEX(CONVERT(s1 USING ucs2)) FROM tj;
+-----+-----+
| s1    | HEX(CONVERT(s1 USING ucs2)) |
+-----+-----+
| が    | 304C                        |
| か    | 304B                        |
+-----+-----+
```

Now we search for `304B` and `304C` in the `4.0.0 allkeys` table, and find these lines:

```
304B ; [.1E57.0020.000E.304B] # HIRAGANA LETTER KA
304C ; [.1E57.0020.000E.304B][.0000.0140.0002.3099] # HIRAGANA LETTER GA; QQCM
```

The official Unicode names (following the “#” mark) tell us the Japanese syllabary (Hiragana), the informal classification (letter, digit, or punctuation mark), and the Western identifier (`KA`)

or `GA`, which happen to be voiced and unvoiced components of the same letter pair). More importantly, the *primary weight* (the first hexadecimal number inside the square brackets) is `1E57` on both lines. For comparisons in both searching and sorting, MySQL pays attention to the primary weight only, ignoring all the other numbers. This means that we are sorting `ガ` and `カ` correctly according to the Unicode specification. If we wanted to distinguish them, we'd have to use a non-UCA (Unicode Collation Algorithm) collation (`utf8_bin` or `utf8_general_ci`), or to compare the `HEX()` values, or use `ORDER BY CONVERT(s1 USING sjis)`. Being correct “according to Unicode” is not enough, of course: the person who submitted the bug was equally correct. To solve this, we need another collation for Japanese according to the JIS X 4061 standard, in which voiced/unvoiced letter pairs like `KA/GA` are distinguishable for ordering purposes.

#### A.11.14 Why do CJK strings sort incorrectly in Unicode? (II)

##### Note

The CJK sorting problems described here can occur for MySQL versions prior to MySQL 8.0. As of MySQL 8.0, they can be solved by using the `utf8mb4` character set and the `utf8mb4_ja_0900_as_cs` collation.

If you are using Unicode (`ucs2` or `utf8`), and you know what the Unicode sort order is (see [Section A.11, “MySQL 5.7 FAQ: MySQL Chinese, Japanese, and Korean Character Sets”](#)), but MySQL still seems to sort your table incorrectly, first verify the character set in the table definition:

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
Table: t
Create Table: CREATE TABLE `t` (
`s1` char(1) CHARACTER SET ucs2 DEFAULT NULL
) ENGINE=MyISAM DEFAULT CHARSET=latin1
```

Since the character set for the column `s1` appears to be correct (`ucs2`), check what information the `INFORMATION_SCHEMA.COLUMNS` table can provide about this column:

```
mysql> SELECT COLUMN_NAME, CHARACTER_SET_NAME, COLLATION_NAME
FROM INFORMATION_SCHEMA.COLUMNS
WHERE COLUMN_NAME = 's1'
AND TABLE_NAME = 't';
```

COLUMN_NAME	CHARACTER_SET_NAME	COLLATION_NAME
s1	ucs2	ucs2_general_ci

(See [Section 24.5, “The INFORMATION\\_SCHEMA COLUMNS Table”](#), for more information.)

You can see that the collation is `ucs2_general_ci` instead of `ucs2_unicode_ci`. The reason why this is so can be found using `SHOW CHARACTER SET`, as shown here:

```
mysql> SHOW CHARACTER SET LIKE 'ucs2%';
```

Charset	Description	Default collation	Maxlen
ucs2	UCS-2 Unicode	ucs2_general_ci	2

For `ucs2` and `utf8`, the default collation is “general”. To specify a Unicode UCA collation, use `COLLATE ucs2_unicode_ci`, as shown in the preceding item.

#### A.11.15 Why are my supplementary characters rejected by MySQL?

Supplementary characters lie outside the Unicode *Basic Multilingual Plane / Plane 0*. BMP characters have code point values between `U+0000` and `U+FFFF`. Supplementary characters have code point values between `U+10000` and `U+10FFFF`.

To store supplementary characters, you must use a character set that permits them:

- The `utf8` and `ucs2` character sets support BMP characters only.

The `utf8` character set permits only `UTF-8` characters that take up to three bytes. This has led to reports such as that found in Bug #12600, which we rejected as “not a bug”. With `utf8`, MySQL must truncate an input string when it encounters bytes that it does not understand. Otherwise, it is unknown how long the bad multibyte character is.

One possible workaround is to use `ucs2` instead of `utf8`, in which case the “bad” characters are changed to question marks. However, no truncation takes place. You can also change the data type to `BLOB` or `BINARY`, which perform no validity checking.

- The `utf8mb4`, `utf16`, `utf16le`, and `utf32` character sets support BMP characters, as well as supplementary characters outside the BMP.

#### A.11.16 Should “CJK” be “CJKV”?

No. The term “CJKV” (*Chinese Japanese Korean Vietnamese*) refers to Vietnamese character sets which contain Han (originally Chinese) characters. MySQL supports the modern Vietnamese script with Western characters, but does not support the old Vietnamese script using Han characters.

As of MySQL 5.6, there are Vietnamese collations for Unicode character sets, as described in [Section 10.10.1, “Unicode Character Sets”](#).

#### A.11.17 Does MySQL permit CJK characters to be used in database and table names?

Yes.

#### A.11.18 Where can I find translations of the MySQL Manual into Chinese, Japanese, and Korean?

The Japanese translation of the MySQL 5.6 manual can be downloaded from <https://dev.mysql.com/doc/>.

#### A.11.19 Where can I get help with CJK and related issues in MySQL?

The following resources are available:

- A listing of MySQL user groups can be found at <https://wikis.oracle.com/display/mysql/List+of+MySQL+User+Groups>.
- View feature requests relating to character set issues at <http://tinyurl.com/y6xcuf>.
- Visit the MySQL [Character Sets, Collation, Unicode Forum](#). <http://forums.mysql.com/> also provides foreign-language forums.

## A.12 MySQL 5.7 FAQ: Connectors & APIs

For common questions, issues, and answers relating to the MySQL Connectors and other APIs, see the following areas of the Manual:

- [Section 27.8.21, “C API Common Issues”](#)
- [Common Problems with MySQL and PHP](#)
- [Connector/ODBC Notes and Tips](#)

- [Connector/NET Programming](#)
- [MySQL Connector/J 5.1 Developer Guide](#)

## A.13 MySQL 5.7 FAQ: Replication

In the following section, we provide answers to questions that are most frequently asked about MySQL Replication.

A.13.1 Must the slave be connected to the master all the time? .....	4288
A.13.2 Must I enable networking on my master and slave to enable replication? .....	4288
A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave? .....	4288
A.13.4 How do I force the master to block updates until the slave catches up? .....	4289
A.13.5 What issues should I be aware of when setting up two-way replication? .....	4289
A.13.6 How can I use replication to improve performance of my system? .....	4289
A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing replication? .....	4289
A.13.8 When and how much can MySQL replication improve the performance of my system? .....	4290
A.13.9 How can I use replication to provide redundancy or high availability? .....	4291
A.13.10 How do I tell whether a master server is using statement-based or row-based binary logging format? .....	4291
A.13.11 How do I tell a slave to use row-based replication? .....	4291
A.13.12 How do I prevent <a href="#">GRANT</a> and <a href="#">REVOKE</a> statements from replicating to slave machines? ....	4291
A.13.13 Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)? .....	4291
A.13.14 Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)? .....	4291

### A.13.1 Must the slave be connected to the master all the time?

No, it does not. The slave can go down or stay disconnected for hours or even days, and then reconnect and catch up on updates. For example, you can set up a master/slave relationship over a dial-up link where the link is up only sporadically and for short periods of time. The implication of this is that, at any given time, the slave is not guaranteed to be in synchrony with the master unless you take some special measures.

To ensure that catchup can occur for a slave that has been disconnected, you must not remove binary log files from the master that contain information that has not yet been replicated to the slaves. Asynchronous replication can work only if the slave is able to continue reading the binary log from the point where it last read events.

### A.13.2 Must I enable networking on my master and slave to enable replication?

Yes, networking must be enabled on the master and slave. If networking is not enabled, the slave cannot connect to the master and transfer the binary log. Check that the [skip-networking](#) option has not been enabled in the configuration file for either server.

### A.13.3 How do I know how late a slave is compared to the master? In other words, how do I know the date of the last statement replicated by the slave?

Check the [Seconds\\_Behind\\_Master](#) column in the output from [SHOW SLAVE STATUS](#). See [Section 16.1.7.1, “Checking Replication Status”](#).

When the slave SQL thread executes an event read from the master, it modifies its own time to the event timestamp. (This is why [TIMESTAMP](#) is well replicated.) In the [Time](#) column in the output of [SHOW PROCESSLIST](#), the number of seconds displayed for the slave SQL thread is the number of seconds between the timestamp of the last replicated event and the real time of the slave machine. You can use this to determine the date of the last replicated event. Note that if your slave has been disconnected from the master for one hour, and then reconnects,

you may immediately see large `Time` values such as 3600 for the slave SQL thread in `SHOW PROCESSLIST`. This is because the slave is executing statements that are one hour old. See [Section 16.2.2, “Replication Implementation Details”](#).

#### A.13.4 How do I force the master to block updates until the slave catches up?

Use the following procedure:

1. On the master, execute these statements:

```
mysql> FLUSH TABLES WITH READ LOCK;  
mysql> SHOW MASTER STATUS;
```

Record the replication coordinates (the current binary log file name and position) from the output of the `SHOW` statement.

2. On the slave, issue the following statement, where the arguments to the `MASTER_POS_WAIT()` function are the replication coordinate values obtained in the previous step:

```
mysql> SELECT MASTER_POS_WAIT('log_name', log_pos);
```

The `SELECT` statement blocks until the slave reaches the specified log file and position. At that point, the slave is in synchrony with the master and the statement returns.

3. On the master, issue the following statement to enable the master to begin processing updates again:

```
mysql> UNLOCK TABLES;
```

#### A.13.5 What issues should I be aware of when setting up two-way replication?

MySQL replication currently does not support any locking protocol between master and slave to guarantee the atomicity of a distributed (cross-server) update. In other words, it is possible for client A to make an update to co-master 1, and in the meantime, before it propagates to co-master 2, client B could make an update to co-master 2 that makes the update of client A work differently than it did on co-master 1. Thus, when the update of client A makes it to co-master 2, it produces tables that are different from what you have on co-master 1, even after all the updates from co-master 2 have also propagated. This means that you should not chain two servers together in a two-way replication relationship unless you are sure that your updates can safely happen in any order, or unless you take care of mis-ordered updates somehow in the client code.

You should also realize that two-way replication actually does not improve performance very much (if at all) as far as updates are concerned. Each server must do the same number of updates, just as you would have a single server do. The only difference is that there is a little less lock contention because the updates originating on another server are serialized in one slave thread. Even this benefit might be offset by network delays.

#### A.13.6 How can I use replication to improve performance of my system?

Set up one server as the master and direct all writes to it. Then configure as many slaves as you have the budget and rackspace for, and distribute the reads among the master and the slaves. You can also start the slaves with the `--skip-innodb`, `--low-priority-updates`, and `--delay-key-write=ALL` options to get speed improvements on the slave end. In this case, the slave uses nontransactional `MyISAM` tables instead of `InnoDB` tables to get more speed by eliminating transactional overhead.

#### A.13.7 What should I do to prepare client code in my own applications to use performance-enhancing replication?

See the guide to using replication as a scale-out solution, [Section 16.3.4, “Using Replication for Scale-Out”](#).

**A.13.8** When and how much can MySQL replication improve the performance of my system?

MySQL replication is most beneficial for a system that processes frequent reads and infrequent writes. In theory, by using a single-master/multiple-slave setup, you can scale the system by adding more slaves until you either run out of network bandwidth, or your update load grows to the point that the master cannot handle it.

To determine how many slaves you can use before the added benefits begin to level out, and how much you can improve performance of your site, you must know your query patterns, and determine empirically by benchmarking the relationship between the throughput for reads and writes on a typical master and a typical slave. The example here shows a rather simplified calculation of what you can get with replication for a hypothetical system. Let `reads` and `writes` denote the number of reads and writes per second, respectively.

Let's say that system load consists of 10% writes and 90% reads, and we have determined by benchmarking that `reads` is  $1200 - 2 * \text{writes}$ . In other words, the system can do 1,200 reads per second with no writes, the average write is twice as slow as the average read, and the relationship is linear. Suppose that the master and each slave have the same capacity, and that we have one master and  $N$  slaves. Then we have for each server (master or slave):

$$\text{reads} = 1200 - 2 * \text{writes}$$

$$\text{reads} = 9 * \text{writes} / (N + 1) \text{ (reads are split, but writes replicated to all slaves)}$$

$$9 * \text{writes} / (N + 1) + 2 * \text{writes} = 1200$$

$$\text{writes} = 1200 / (2 + 9/(N + 1))$$

The last equation indicates the maximum number of writes for  $N$  slaves, given a maximum possible read rate of 1,200 per second and a ratio of nine reads per write.

This analysis yields the following conclusions:

- If  $N = 0$  (which means we have no replication), our system can handle about  $1200/11 = 109$  writes per second.
- If  $N = 1$ , we get up to 184 writes per second.
- If  $N = 8$ , we get up to 400 writes per second.
- If  $N = 17$ , we get up to 480 writes per second.
- Eventually, as  $N$  approaches infinity (and our budget negative infinity), we can get very close to 600 writes per second, increasing system throughput about 5.5 times. However, with only eight servers, we increase it nearly four times.

These computations assume infinite network bandwidth and neglect several other factors that could be significant on your system. In many cases, you may not be able to perform a computation similar to the one just shown that accurately predicts what will happen on your system if you add  $N$  replication slaves. However, answering the following questions should help you decide whether and by how much replication will improve the performance of your system:

- What is the read/write ratio on your system?
- How much more write load can one server handle if you reduce the reads?
- For how many slaves do you have bandwidth available on your network?

**A.13.9**How can I use replication to provide redundancy or high availability?

How you implement redundancy is entirely dependent on your application and circumstances. High-availability solutions (with automatic failover) require active monitoring and either custom scripts or third party tools to provide the failover support from the original MySQL server to the slave.

To handle the process manually, you should be able to switch from a failed master to a pre-configured slave by altering your application to talk to the new server or by adjusting the DNS for the MySQL server from the failed server to the new server.

For more information and some example solutions, see [Section 16.3.7, “Switching Masters During Failover”](#).

**A.13.10**How do I tell whether a master server is using statement-based or row-based binary logging format?

Check the value of the `binlog_format` system variable:

```
mysql> SHOW VARIABLES LIKE 'binlog_format';
```

The value shown will be one of `STATEMENT`, `ROW`, or `MIXED`. For `MIXED` mode, statement-based logging is used by default but replication switches automatically to row-based logging under certain conditions, such as unsafe statements. For information about when this may occur, see [Section 5.4.4.3, “Mixed Binary Logging Format”](#).

**A.13.11**How do I tell a slave to use row-based replication?

Slaves automatically know which format to use.

**A.13.12**How do I prevent `GRANT` and `REVOKE` statements from replicating to slave machines?

Start the server with the `--replicate-wild-ignore-table=mysql.%` option to ignore replication for tables in the `mysql` database.

**A.13.13**Does replication work on mixed operating systems (for example, the master runs on Linux while slaves run on OS X and Windows)?

Yes.

**A.13.14**Does replication work on mixed hardware architectures (for example, the master runs on a 64-bit machine while slaves run on 32-bit machines)?

Yes.

## A.14 MySQL 5.7 FAQ: MySQL Enterprise Thread Pool

A.14.1 What is the Thread Pool and what problem does it solve? .....	4291
A.14.2 How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput? .....	4292
A.14.3 How is the Thread Pool different from the client side Connection Pool? .....	4292
A.14.4 When should I use the Thread Pool? .....	4292
A.14.5 Are there recommended Thread Pool configurations? .....	4292

**A.14.1**What is the Thread Pool and what problem does it solve?

The MySQL Thread Pool is a MySQL server plugin that extends the default connection-handling capabilities of the MySQL server to limit the number of concurrently executing statements/queries and transactions to ensure that each has sufficient CPU and memory resources to fulfill its task. For MySQL 5.7, the Thread Pool plugin is included in MySQL Enterprise Edition, a commercial product.

The default thread-handling model in MySQL Server executes statements using one thread per client connection. As more clients connect to the server and execute statements, overall performance degrades. The Thread Pool plugin provides an alternative thread-handling model designed to reduce overhead and improve performance. The Thread Pool plugin increases server performance by efficiently managing statement execution threads for large numbers of client connections, especially on modern multi-CPU/Core systems.

For more information, see [Section 5.5.3, “MySQL Enterprise Thread Pool”](#).

**A.14.2**How does the Thread Pool limit and manage concurrent sessions and transactions for optimal performance and throughput?

The Thread Pool uses a “divide and conquer” approach to limiting and balancing concurrency. Unlike the default connection handling of the MySQL Server, the Thread Pool separates connections and threads, so there is no fixed relationship between connections and the threads that execute statements received from those connections. The Thread Pool then manages client connections within configurable thread groups, where they are prioritized and queued based on the nature of the work they were submitted to accomplish.

For more information, see [Section 5.5.3.3, “Thread Pool Operation”](#).

**A.14.3**How is the Thread Pool different from the client side Connection Pool?

The MySQL Connection Pool operates on the client side to ensure that a MySQL client does not constantly connect to and disconnect from the MySQL server. It is designed to cache idle connections in the MySQL client for use by other users as they are needed. This minimizes the overhead and expense of establishing and tearing down connections as queries are submitted to the MySQL server. The MySQL Connection Pool has no visibility as to the query handling capabilities or load of the back-end MySQL server. By contrast, the Thread Pool operates on the MySQL server side and is designed to manage the execution of inbound concurrent connections and queries as they are received from the client connections accessing the back-end MySQL database. Because of the separation of duties, the MySQL Connection Pool and Thread Pool are orthogonal and can be used independent of each other.

MySQL Connection Pooling via the MySQL Connectors is covered in [Chapter 27, Connectors and APIs](#).

**A.14.4**When should I use the Thread Pool?

There are a few rules of thumb to consider for optimal Thread Pool use cases:

The MySQL `Threads_running` variable keeps track of the number of concurrent statements currently executing in the MySQL Server. If this variable consistently exceeds a region where the server won't operate optimally (usually going beyond 40 for InnoDB workloads), the Thread Pool will be beneficial, especially in extreme parallel overload situations.

If you are using the `innodb_thread_concurrency` to limit the number of concurrently executing statements, you will find the Thread Pool solves the same problem, only better, by assigning connections to thread groups, then queuing executions based on transactional content, user defined designations, and so forth.

Lastly, if your workload comprises mainly short queries, the Thread Pool will be beneficial.

To learn more, see [Section 5.5.3.4, “Thread Pool Tuning”](#).

**A.14.5**Are there recommended Thread Pool configurations?

The Thread Pool has a number of user case driven configuration parameters that affect its performance. To learn about these and tips on tuning, see [Section 5.5.3.4, “Thread Pool Tuning”](#).

## A.15 MySQL 5.7 FAQ: InnoDB Change Buffer

A.15.1 What types of operations modify secondary indexes and result in change buffering? .....	4293
A.15.2 What is the benefit of the <code>InnoDB</code> change buffer? .....	4293
A.15.3 Does the change buffer support other types of indexes? .....	4293
A.15.4 How much space does <code>InnoDB</code> use for the change buffer? .....	4293
A.15.5 How do I determine the current size of the change buffer? .....	4293
A.15.6 When does change buffer merging occur? .....	4294
A.15.7 When is the change buffer flushed? .....	4294
A.15.8 When should the change buffer be used? .....	4294
A.15.9 When should the change buffer not be used? .....	4294
A.15.10 Where can I find additional information about the change buffer? .....	4294

### A.15.1 What types of operations modify secondary indexes and result in change buffering?

`INSERT`, `UPDATE`, and `DELETE` operations can modify secondary indexes. If an affected index page is not in the buffer pool, the changes can be buffered in the change buffer.

### A.15.2 What is the benefit of the `InnoDB` change buffer?

Buffering secondary index changes when secondary index pages are not in the buffer pool avoids expensive random access I/O operations that would be required to immediately read in affected index pages from disk. Buffered changes can be applied later, in batches, as pages are read into the buffer pool by other read operations.

### A.15.3 Does the change buffer support other types of indexes?

No. The change buffer only supports secondary indexes. Clustered indexes, full-text indexes, and spatial indexes are not supported. Full-text indexes have their own caching mechanism.

### A.15.4 How much space does `InnoDB` use for the change buffer?

Prior to the introduction of the `innodb_change_buffer_max_size` configuration option in MySQL 5.6, the maximum size of the on-disk change buffer in the system tablespace was 1/3 of the `InnoDB` buffer pool size.

In MySQL 5.6 and later, the `innodb_change_buffer_max_size` configuration option defines the maximum size of the change buffer as a percentage of the total buffer pool size. By default, `innodb_change_buffer_max_size` is set to 25. The maximum setting is 50.

`InnoDB` does not buffer an operation if it would cause the on-disk change buffer to exceed the defined limit.

Change buffer pages are not required to persist in the buffer pool and may be evicted by LRU operations.

### A.15.5 How do I determine the current size of the change buffer?

The current size of the change buffer is reported by `SHOW ENGINE INNODB STATUS \G`, under the `INSERT BUFFER AND ADAPTIVE HASH INDEX` heading. For example:

```
-----
INSERT BUFFER AND ADAPTIVE HASH INDEX
-----
Ibuf: size 1, free list len 0, seg size 2, 0 merges
```

Relevant data points include:

- `size`: The number of pages used within the change buffer. Change buffer size is equal to `seg size - (1 + free list len)`. The `1 +` value represents the change buffer header page.

- `seg size`: The size of the change buffer, in pages.

For information about monitoring change buffer status, see [Section 14.4.2, “Change Buffer”](#).

#### A.15.6 When does change buffer merging occur?

- When a page is read into the buffer pool, buffered changes are merged upon completion of the read, before the page is made available.
- Change buffer merging is performed as a background task. The `innodb_io_capacity` parameter sets an upper limit on the I/O activity performed by InnoDB background tasks such as merging data from the change buffer.
- A change buffer merge is performed during crash recovery. Changes are applied from the change buffer (in the system tablespace) to leaf pages of secondary indexes as index pages are read into the buffer pool.
- The change buffer is fully durable and will survive a system crash. Upon restart, change buffer merge operations resume as part of normal operations.
- A full merge of the change buffer can be forced as part of a slow server shutdown using `--innodb-fast-shutdown=0`.

#### A.15.7 When is the change buffer flushed?

Updated pages are flushed by the same flushing mechanism that flushes the other pages that occupy the buffer pool.

#### A.15.8 When should the change buffer be used?

The change buffer is a feature designed to reduce random I/O to secondary indexes as indexes grow larger and no longer fit in the InnoDB buffer pool. Generally, the change buffer should be used when the entire data set does not fit into the buffer pool, when there is substantial DML activity that modifies secondary index pages, or when there are lots of secondary indexes that are regularly changed by DML activity.

#### A.15.9 When should the change buffer not be used?

You might consider disabling the change buffer if the entire data set fits within the InnoDB buffer pool, if you have relatively few secondary indexes, or if you are using solid-state storage, where random reads are about as fast as sequential reads. Before making configuration changes, it is recommended that you run tests using a representative workload to determine if disabling the change buffer provides any benefit.

#### A.15.10 Where can I find additional information about the change buffer?

The following sections and blog post provide additional information about the InnoDB change buffer:

- [Section 14.4.2, “Change Buffer”](#)
- [Section 14.6.5, “Configuring InnoDB Change Buffering”](#)
- [MySQL 5.5: InnoDB Change Buffering](#)

## A.16 MySQL 5.7 FAQ: InnoDB Tablespace Encryption

A.16.1 Is data decrypted for users who are authorized to see it? .....	4295
A.16.2 What is the overhead associated with InnoDB tablespace encryption? .....	4295
A.16.3 What are the encryption algorithms used with InnoDB tablespace encryption? .....	4295

A.16.4 Is it possible to use 3rd party encryption algorithms in place of the one provided by the <a href="#">InnoDB</a> tablespace encryption feature? .....	4295
A.16.5 Can indexed columns be encrypted? .....	4295
A.16.6 What data types and data lengths does <a href="#">InnoDB</a> tablespace encryption support? .....	4295
A.16.7 Does data remain encrypted on the network? .....	4295
A.16.8 Does database memory contain clear-text or encrypted data? .....	4295
A.16.9 How do I know which data to encrypt? .....	4296
A.16.10 How is <a href="#">InnoDB</a> tablespace encryption different from encryption functions MySQL already provides? .....	4296
A.16.11 Does the transportable tablespaces feature work with <a href="#">InnoDB</a> tablespace encryption? ...	4296
A.16.12 Does compression work with <a href="#">InnoDB</a> tablespace encryption? .....	4296
A.16.13 Can I use <a href="#">mysqldump</a> or <a href="#">mysqlpump</a> with encrypted tables? .....	4296
A.16.14 How do I change (rotate, re-key) the master encryption key? .....	4296
A.16.15 How do I migrate data from a clear-text <a href="#">InnoDB</a> tablespace to an encrypted <a href="#">InnoDB</a> tablespace? .....	4296
A.16.16 Can the <a href="#">InnoDB</a> tablespace encryption feature store the master encryption key in an external device using the PKSC11 interface? .....	4296

**A.16.1**Is data decrypted for users who are authorized to see it?

Yes. [InnoDB](#) tablespace encryption is designed to provide customers with the ability to transparently apply encryption within the database without impacting existing applications. Returning data in encrypted format would break most existing applications. [InnoDB](#) tablespace encryption provides the benefit of encryption without the overhead associated with traditional database encryption solutions, which would typically require expensive and substantial changes to applications, database triggers, and views.

**A.16.2**What is the overhead associated with [InnoDB](#) tablespace encryption?

There is no additional storage overhead. According to internal benchmarks, performance overhead amounts to a single digit percentage difference.

**A.16.3**What are the encryption algorithms used with [InnoDB](#) tablespace encryption?

[InnoDB](#) tablespace encryption supports the Advanced Encryption Standard (AES256) block-based encryption algorithm. It uses Electronic Codebook (ECB) block encryption mode for tablespace key encryption and Cipher Block Chaining (CBC) block encryption mode for data encryption.

**A.16.4**Is it possible to use 3rd party encryption algorithms in place of the one provided by the [InnoDB](#) tablespace encryption feature?

No, it is not possible to use other encryption algorithms. The provided encryption algorithm is broadly accepted.

**A.16.5**Can indexed columns be encrypted?

[InnoDB](#) tablespace encryption supports all indexes transparently.

**A.16.6**What data types and data lengths does [InnoDB](#) tablespace encryption support?

[InnoDB](#) tablespace encryption supports all supported data types. There is no data length limitation.

**A.16.7**Does data remain encrypted on the network?

Data encrypted by the [InnoDB](#) tablespace encryption feature is decrypted when it is read from the tablespace file. Thus, if the data is on the network, it is in clear-text form. However, data on the network can be encrypted using MySQL network encryption, which encrypts data traveling to and from a database using SSL/TLS.

**A.16.8**Does database memory contain clear-text or encrypted data?

With [InnoDB](#) tablespace encryption, in-memory data is decrypted, which provides complete transparency.

**A.16.9**How do I know which data to encrypt?

Compliance with the PCI-DSS standard requires that credit card numbers (Primary Account Number, or 'PAN') be stored in encrypted form. Breach Notification Laws (for example, CA SB 1386, CA AB 1950, and similar laws in 43+ more US states) require encryption of first name, last name, driver license number, and other PII data. In early 2008, CA AB 1298 added medical and health insurance information to PII data. Additionally, industry specific privacy and security standards may require encryption of certain assets. For example, assets such as pharmaceutical research results, oil field exploration results, financial contracts, or personal data of law enforcement informants may require encryption. In the health care industry, the privacy of patient data, health records and X-ray images is of the highest importance.

**A.16.10**How is [InnoDB](#) tablespace encryption different from encryption functions MySQL already provides?

There are symmetric and asymmetric encryption APIs in MySQL that can be used to manually encrypt data within the database. However, the application must manage encryption keys and perform required encryption and decryption operations by calling API functions. [InnoDB](#) tablespace encryption requires no application changes, is transparent to end users, and provides automated, built-in key management.

**A.16.11**Does the transportable tablespaces feature work with [InnoDB](#) tablespace encryption?

Yes. It is supported for encrypted file-per-table tablespaces. For more information, see [Exporting Encrypted Tablespaces](#).

**A.16.12**Does compression work with [InnoDB](#) tablespace encryption?

Customers using [InnoDB](#) tablespace encryption receive the full benefit of compression because compression is applied before data blocks are encrypted.

**A.16.13**Can I use [mysqlpump](#) or [mysqldump](#) with encrypted tables?

Yes. Because these utilities create logical backups, the data dumped from encrypted tables is not encrypted.

**A.16.14**How do I change (rotate, re-key) the master encryption key?

[InnoDB](#) tablespace encryption uses a two tier key mechanism. When tablespace encryption is used, individual tablespace keys are stored in the header of the underlying tablespace data file. Tablespace keys are encrypted using the master encryption key. The master encryption key is generated when tablespace encryption is enabled, and is stored outside the database. The master encryption key is rotated using the [ALTER INSTANCE ROTATE INNODB MASTER KEY](#) statement, which generates a new master encryption key, stores the key, and rotates the key into use.

**A.16.15**How do I migrate data from a clear-text [InnoDB](#) tablespace to an encrypted [InnoDB](#) tablespace?

Transferring data from one tablespace to another is not required. To encrypt data in an [InnoDB](#) file-per-table tablespace, run [ALTER TABLE \*tbl\\_name\* ENCRYPTION='Y'](#). To encrypt a general tablespace, run [ALTER TABLESPACE \*tablespace\\_name\* ENCRYPTION='Y'](#). Encryption support for general tablespaces was introduced in MySQL 8.0.13.

**A.16.16**Can the [InnoDB](#) tablespace encryption feature store the master encryption key in an external device using the PKSC11 interface?

Not at this time. Currently, the KMIP 1.1 protocol is supported with the [keyring\\_okv](#) plugin, which is available with MySQL Enterprise Edition.

## A.17 MySQL 5.7 FAQ: Virtualization Support

A.17.1 Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others? ..... 4297

**A.17.1** Is MySQL supported on virtualized environments such as Oracle VM, VMWare, Docker, Microsoft Hyper-V, or others?

MySQL is supported on virtualized environments, but is certified only for [Oracle VM](#). Contact Oracle Support for more information.

Be aware of potential problems when using virtualization software. The usual ones are related to performance, performance degradations, slowness, or unpredictability of disk, I/O, network, and memory.

---

## Appendix B Errors, Error Codes, and Common Problems

### Table of Contents

B.1 Sources of Error Information .....	4299
B.2 Types of Error Values .....	4299
B.3 Server Error Codes and Messages .....	4300
B.4 Client Error Codes and Messages .....	4389
B.5 Problems and Common Errors .....	4394
B.5.1 How to Determine What Is Causing a Problem .....	4394
B.5.2 Common Errors When Using MySQL Programs .....	4395
B.5.3 Administration-Related Issues .....	4407
B.5.4 Query-Related Issues .....	4415
B.5.5 Optimizer-Related Issues .....	4422
B.5.6 Table Definition-Related Issues .....	4422
B.5.7 Known Issues in MySQL .....	4424

This appendix lists common problems and errors that may occur and potential resolutions, in addition to listing the errors that may appear when you call MySQL from any host language. The first section covers problems and resolutions. Detailed information on errors is provided: One list displays server error messages. Another list displays client program messages.

### B.1 Sources of Error Information

There are several sources of error information in MySQL:

- Each SQL statement executed results in an error code, an SQLSTATE value, and an error message, as described in [Section B.2, “Types of Error Values”](#). These errors are returned from the server side; see [Section B.3, “Server Error Codes and Messages”](#).
- Errors can occur on the client side, usually involving problems communicating with the server; see [Section B.4, “Client Error Codes and Messages”](#).
- SQL statement warning and error information is available through the `SHOW WARNINGS` and `SHOW ERRORS` statements. The `warning_count` system variable indicates the number of errors, warnings, and notes. The `error_count` system variable indicates the number of errors. Its value excludes warnings and notes.
- The `GET DIAGNOSTICS` statement may be used to inspect the diagnostic information in the diagnostics area. See [Section 13.6.7.3, “GET DIAGNOSTICS Syntax”](#).
- `SHOW SLAVE STATUS` statement output includes information about replication errors occurring on the slave side.
- `SHOW ENGINE INNODB STATUS` statement output includes information about the most recent foreign key error if a `CREATE TABLE` statement for an `InnoDB` table fails.
- The `pererror` program provides information from the command line about error numbers. See [Section 4.8.2, “pererror — Explain Error Codes”](#).

Descriptions of server and client errors are provided later in this Appendix. For information about errors related to `InnoDB`, see [Section 14.21.4, “InnoDB Error Handling”](#).

### B.2 Types of Error Values

When an error occurs in MySQL, the server returns two types of error values:

- A MySQL-specific error code. This value is numeric. It is not portable to other database systems.

- An SQLSTATE value. The value is a five-character string (for example, '42S02'). The values are taken from ANSI SQL and ODBC and are more standardized.

A message string that provides a textual description of the error is also available.

When an error occurs, the MySQL error code, SQLSTATE value, and message string are available using C API functions:

- MySQL error code: Call `mysql_errno()`
- SQLSTATE value: Call `mysql_sqlstate()`
- Error message: Call `mysql_error()`

For prepared statements, the corresponding error functions are `mysql_stmt_errno()`, `mysql_stmt_sqlstate()`, and `mysql_stmt_error()`. All error functions are described in [Section 27.8, “MySQL C API”](#).

The number of errors, warnings, and notes for the previous statement can be obtained by calling `mysql_warning_count()`. See [Section 27.8.7.78, “mysql\\_warning\\_count\(\)”](#).

The first two characters of an SQLSTATE value indicate the error class:

- Class = '00' indicates success.
- Class = '01' indicates a warning.
- Class = '02' indicates “not found.” This is relevant within the context of cursors and is used to control what happens when a cursor reaches the end of a data set. This condition also occurs for `SELECT ... INTO var_list` statements that retrieve no rows.
- Class > '02' indicates an exception.

## B.3 Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error code (1146). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value ('42S02'). The values are taken from ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers have corresponding SQLSTATE values. In these cases, 'HY000' (general error) is used.
- A message string that provides a textual description of the error.

For error checking, use error codes, not error messages. Error messages do not change often, but it is possible. Also if the database administrator changes the language setting, that affects the language of error messages.

Error codes are stable across GA releases of a given MySQL series. Before a series reaches GA status, new codes may still be under development and subject to change.

Server error information comes from the following source files. For details about the way that error information is defined, see the [MySQL Internals Manual](#).

- Error message information is listed in the `share/errmsg-utf8.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the Message values when they are displayed.
- The Error values listed in `share/errmsg-utf8.txt` are used to generate the definitions in the `include/mysql_error.h` and `include/mysql_ename.h` MySQL source files.
- The SQLSTATE values listed in `share/errmsg-utf8.txt` are used to generate the definitions in the `include/sql_state.h` MySQL source file.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: 1 SQLSTATE: HY000 (EE\_CANTCREATEFILE)  
Message: Can't create/write to file '%s' (Errcode: %d - %s)
- Error: 2 SQLSTATE: HY000 (EE\_READ)  
Message: Error reading file '%s' (Errcode: %d - %s)
- Error: 3 SQLSTATE: HY000 (EE\_WRITE)  
Message: Error writing file '%s' (Errcode: %d - %s)
- Error: 4 SQLSTATE: HY000 (EE\_BADCLOSE)  
Message: Error on close of '%s' (Errcode: %d - %s)
- Error: 5 SQLSTATE: HY000 (EE\_OUTOFMEMORY)  
Message: Out of memory (Needed %u bytes)
- Error: 6 SQLSTATE: HY000 (EE\_DELETE)  
Message: Error on delete of '%s' (Errcode: %d - %s)
- Error: 7 SQLSTATE: HY000 (EE\_LINK)  
Message: Error on rename of '%s' to '%s' (Errcode: %d - %s)
- Error: 9 SQLSTATE: HY000 (EE\_EOFERR)  
Message: Unexpected EOF found when reading file '%s' (Errcode: %d - %s)
- Error: 10 SQLSTATE: HY000 (EE\_CANTLOCK)  
Message: Can't lock file (Errcode: %d - %s)
- Error: 11 SQLSTATE: HY000 (EE\_CANTUNLOCK)  
Message: Can't unlock file (Errcode: %d - %s)
- Error: 12 SQLSTATE: HY000 (EE\_DIR)  
Message: Can't read dir of '%s' (Errcode: %d - %s)
- Error: 13 SQLSTATE: HY000 (EE\_STAT)  
Message: Can't get stat of '%s' (Errcode: %d - %s)
- Error: 14 SQLSTATE: HY000 (EE\_CANT\_CHSIZE)  
Message: Can't change size of file (Errcode: %d - %s)

- Error: 15 SQLSTATE: HY000 (EE\_CANT\_OPEN\_STREAM)  
Message: Can't open stream from handle (Errcode: %d - %s)
- Error: 16 SQLSTATE: HY000 (EE\_GETWD)  
Message: Can't get working directory (Errcode: %d - %s)
- Error: 17 SQLSTATE: HY000 (EE\_SETWD)  
Message: Can't change dir to '%s' (Errcode: %d - %s)
- Error: 18 SQLSTATE: HY000 (EE\_LINK\_WARNING)  
Message: Warning: '%s' had %d links
- Error: 19 SQLSTATE: HY000 (EE\_OPEN\_WARNING)  
Message: Warning: %d files and %d streams is left open
- Error: 20 SQLSTATE: HY000 (EE\_DISK\_FULL)  
Message: Disk is full writing '%s' (Errcode: %d - %s). Waiting for someone to free space...
- Error: 21 SQLSTATE: HY000 (EE\_CANT\_MKDIR)  
Message: Can't create directory '%s' (Errcode: %d - %s)
- Error: 22 SQLSTATE: HY000 (EE\_UNKNOWN\_CHARSET)  
Message: Character set '%s' is not a compiled character set and is not specified in the '%s' file
- Error: 23 SQLSTATE: HY000 (EE\_OUT\_OF\_FILERESOURCES)  
Message: Out of resources when opening file '%s' (Errcode: %d - %s)
- Error: 24 SQLSTATE: HY000 (EE\_CANT\_READLINK)  
Message: Can't read value for symlink '%s' (Error %d - %s)
- Error: 25 SQLSTATE: HY000 (EE\_CANT\_SYMLINK)  
Message: Can't create symlink '%s' pointing at '%s' (Error %d - %s)
- Error: 26 SQLSTATE: HY000 (EE\_REALPATH)  
Message: Error on realpath() on '%s' (Error %d - %s)
- Error: 27 SQLSTATE: HY000 (EE\_SYNC)  
Message: Can't sync file '%s' to disk (Errcode: %d - %s)
- Error: 28 SQLSTATE: HY000 (EE\_UNKNOWN\_COLLATION)  
Message: Collation '%s' is not a compiled collation and is not specified in the '%s' file
- Error: 29 SQLSTATE: HY000 (EE\_FILENOTFOUND)  
Message: File '%s' not found (Errcode: %d - %s)
- Error: 30 SQLSTATE: HY000 (EE\_FILE\_NOT\_CLOSED)  
Message: File '%s' (fileno: %d) was not closed
- Error: 31 SQLSTATE: HY000 (EE\_CHANGE\_OWNERSHIP)

Message: Can't change ownership of the file '%s' (Errcode: %d - %s)

- Error: 32 SQLSTATE: HY000 (EE\_CHANGE\_PERMISSIONS)

Message: Can't change permissions of the file '%s' (Errcode: %d - %s)

- Error: 33 SQLSTATE: HY000 (EE\_CANT\_SEEK)

Message: Can't seek in file '%s' (Errcode: %d - %s)

- Error: 34 SQLSTATE: HY000 (EE\_CAPACITY\_EXCEEDED)

Message: Memory capacity exceeded (capacity %llu bytes)

EE\_CAPACITY\_EXCEEDED was added in 5.7.9.

- Error: 1000 SQLSTATE: HY000 (ER\_HASHCHK)

Message: hashchk

Unused.

- Error: 1001 SQLSTATE: HY000 (ER\_NISAMCHK)

Message: isamchk

Unused.

- Error: 1002 SQLSTATE: HY000 (ER\_NO)

Message: NO

Used in the construction of other messages.

- Error: 1003 SQLSTATE: HY000 (ER\_YES)

Message: YES

Used in the construction of other messages.

Extended [EXPLAIN](#) format generates Note messages. [ER\\_YES](#) is used in the [Code](#) column for these messages in subsequent [SHOW WARNINGS](#) output.

- Error: 1004 SQLSTATE: HY000 (ER\_CANT\_CREATE\_FILE)

Message: Can't create file '%s' (errno: %d - %s)

Occurs for failure to create or copy a file needed for some operation.

Possible causes: Permissions problem for source file; destination file already exists but is not writeable.

- Error: 1005 SQLSTATE: HY000 (ER\_CANT\_CREATE\_TABLE)

Message: Can't create table '%s' (errno: %d)

[InnoDB](#) reports this error when a table cannot be created. If the error message refers to error 150, table creation failed because a [foreign key constraint](#) was not correctly formed. If the error message refers to error -1, table creation probably failed because the table includes a column name that matched the name of an internal [InnoDB](#) table.

- Error: 1006 SQLSTATE: HY000 (ER\_CANT\_CREATE\_DB)

Message: Can't create database '%s' (errno: %d)

- Error: 1007 SQLSTATE: HY000 (ER\_DB\_CREATE\_EXISTS)

Message: Can't create database '%s'; database exists

An attempt to create a database failed because the database already exists.

Drop the database first if you really want to replace an existing database, or add an `IF NOT EXISTS` clause to the `CREATE DATABASE` statement if to retain an existing database without having the statement produce an error.

- Error: 1008 SQLSTATE: HY000 (ER\_DB\_DROP\_EXISTS)

Message: Can't drop database '%s'; database doesn't exist

- Error: 1009 SQLSTATE: HY000 (ER\_DB\_DROP\_DELETE)

Message: Error dropping database (can't delete '%s', errno: %d)

- Error: 1010 SQLSTATE: HY000 (ER\_DB\_DROP\_RMDIR)

Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: 1011 SQLSTATE: HY000 (ER\_CANT\_DELETE\_FILE)

Message: Error on delete of '%s' (errno: %d - %s)

- Error: 1012 SQLSTATE: HY000 (ER\_CANT\_FIND\_SYSTEM\_REC)

Message: Can't read record in system table

Returned by InnoDB for attempts to access InnoDB INFORMATION\_SCHEMA tables when InnoDB is unavailable.

- Error: 1013 SQLSTATE: HY000 (ER\_CANT\_GET\_STAT)

Message: Can't get status of '%s' (errno: %d - %s)

- Error: 1014 SQLSTATE: HY000 (ER\_CANT\_GET\_WD)

Message: Can't get working directory (errno: %d - %s)

- Error: 1015 SQLSTATE: HY000 (ER\_CANT\_LOCK)

Message: Can't lock file (errno: %d - %s)

- Error: 1016 SQLSTATE: HY000 (ER\_CANT\_OPEN\_FILE)

Message: Can't open file: '%s' (errno: %d - %s)

InnoDB reports this error when the table from the InnoDB data files cannot be found, even though the `.frm` file for the table exists. See [Section 14.21.3, “Troubleshooting InnoDB Data Dictionary Operations”](#).

- Error: 1017 SQLSTATE: HY000 (ER\_FILE\_NOT\_FOUND)

Message: Can't find file: '%s' (errno: %d - %s)

- Error: 1018 SQLSTATE: HY000 (ER\_CANT\_READ\_DIR)

Message: Can't read dir of '%s' (errno: %d - %s)

- Error: 1019 SQLSTATE: HY000 (ER\_CANT\_SET\_WD)

Message: Can't change dir to '%s' (errno: %d - %s)

- Error: 1020 SQLSTATE: HY000 (ER\_CHECKREAD)

Message: Record has changed since last read in table '%s'

- Error: 1021 SQLSTATE: HY000 (ER\_DISK\_FULL)

Message: Disk full (%s); waiting for someone to free some space... (errno: %d - %s)

- Error: 1022 SQLSTATE: 23000 (ER\_DUP\_KEY)

Message: Can't write; duplicate key in table '%s'

- Error: 1023 SQLSTATE: HY000 (ER\_ERROR\_ON\_CLOSE)

Message: Error on close of '%s' (errno: %d - %s)

- Error: 1024 SQLSTATE: HY000 (ER\_ERROR\_ON\_READ)

Message: Error reading file '%s' (errno: %d - %s)

- Error: 1025 SQLSTATE: HY000 (ER\_ERROR\_ON\_RENAME)

Message: Error on rename of '%s' to '%s' (errno: %d - %s)

- Error: 1026 SQLSTATE: HY000 (ER\_ERROR\_ON\_WRITE)

Message: Error writing file '%s' (errno: %d - %s)

- Error: 1027 SQLSTATE: HY000 (ER\_FILE\_USED)

Message: '%s' is locked against change

- Error: 1028 SQLSTATE: HY000 (ER\_FILSORT\_ABORT)

Message: Sort aborted

- Error: 1029 SQLSTATE: HY000 (ER\_FORM\_NOT\_FOUND)

Message: View '%s' doesn't exist for '%s'

- Error: 1030 SQLSTATE: HY000 (ER\_GET\_ERRNO)

Message: Got error %d from storage engine

Check the %d value to see what the OS error means. For example, 28 indicates that you have run out of disk space.

- Error: 1031 SQLSTATE: HY000 (ER\_ILLEGAL\_HA)

Message: Table storage engine for '%s' doesn't have this option

- Error: 1032 SQLSTATE: HY000 (ER\_KEY\_NOT\_FOUND)

Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER\_NOT\_FORM\_FILE)

Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER\_NOT\_KEYFILE)

Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER\_OLD\_KEYFILE)  
Message: Old key file for table '%s'; repair it!
- Error: 1036 SQLSTATE: HY000 (ER\_OPEN\_AS\_READONLY)  
Message: Table '%s' is read only
- Error: 1037 SQLSTATE: HY001 (ER\_OUTOFMEMORY)  
Message: Out of memory; restart server and try again (needed %d bytes)
- Error: 1038 SQLSTATE: HY001 (ER\_OUT\_OF\_SORTMEMORY)  
Message: Out of sort memory, consider increasing server sort buffer size
- Error: 1039 SQLSTATE: HY000 (ER\_UNEXPECTED\_EOF)  
Message: Unexpected EOF found when reading file '%s' (errno: %d - %s)
- Error: 1040 SQLSTATE: 08004 (ER\_CON\_COUNT\_ERROR)  
Message: Too many connections
- Error: 1041 SQLSTATE: HY000 (ER\_OUT\_OF\_RESOURCES)  
Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space
- Error: 1042 SQLSTATE: 08S01 (ER\_BAD\_HOST\_ERROR)  
Message: Can't get hostname for your address
- Error: 1043 SQLSTATE: 08S01 (ER\_HANDSHAKE\_ERROR)  
Message: Bad handshake
- Error: 1044 SQLSTATE: 42000 (ER\_DBACCESS\_DENIED\_ERROR)  
Message: Access denied for user '%s'@'%s' to database '%s'
- Error: 1045 SQLSTATE: 28000 (ER\_ACCESS\_DENIED\_ERROR)  
Message: Access denied for user '%s'@'%s' (using password: %s)
- Error: 1046 SQLSTATE: 3D000 (ER\_NO\_DB\_ERROR)  
Message: No database selected
- Error: 1047 SQLSTATE: 08S01 (ER\_UNKNOWN\_COM\_ERROR)  
Message: Unknown command
- Error: 1048 SQLSTATE: 23000 (ER\_BAD\_NULL\_ERROR)  
Message: Column '%s' cannot be null
- Error: 1049 SQLSTATE: 42000 (ER\_BAD\_DB\_ERROR)  
Message: Unknown database '%s'
- Error: 1050 SQLSTATE: 42S01 (ER\_TABLE\_EXISTS\_ERROR)  
Message: Table '%s' already exists
- Error: 1051 SQLSTATE: 42S02 (ER\_BAD\_TABLE\_ERROR)

Message: Unknown table '%s'

- Error: 1052 SQLSTATE: 23000 (ER\_NON\_UNIQ\_ERROR)

Message: Column '%s' in %s is ambiguous

```
%s = column name
%s = location of column (for example, "field list")
```

Likely cause: A column appears in a query without appropriate qualification, such as in a select list or ON clause.

Examples:

```
mysql> SELECT i FROM t INNER JOIN t AS t2;
ERROR 1052 (23000): Column 'i' in field list is ambiguous

mysql> SELECT * FROM t LEFT JOIN t AS t2 ON i = i;
ERROR 1052 (23000): Column 'i' in on clause is ambiguous
```

Resolution:

- Qualify the column with the appropriate table name:

```
mysql> SELECT t2.i FROM t INNER JOIN t AS t2;
```

- Modify the query to avoid the need for qualification:

```
mysql> SELECT * FROM t LEFT JOIN t AS t2 USING (i);
```

- Error: 1053 SQLSTATE: 08S01 (ER\_SERVER\_SHUTDOWN)

Message: Server shutdown in progress

- Error: 1054 SQLSTATE: 42S22 (ER\_BAD\_FIELD\_ERROR)

Message: Unknown column '%s' in '%s'

- Error: 1055 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_WITH\_GROUP)

Message: '%s' isn't in GROUP BY

- Error: 1056 SQLSTATE: 42000 (ER\_WRONG\_GROUP\_FIELD)

Message: Can't group on '%s'

- Error: 1057 SQLSTATE: 42000 (ER\_WRONG\_SUM\_SELECT)

Message: Statement has sum functions and columns in same statement

- Error: 1058 SQLSTATE: 21S01 (ER\_WRONG\_VALUE\_COUNT)

Message: Column count doesn't match value count

- Error: 1059 SQLSTATE: 42000 (ER\_TOO\_LONG\_IDENT)

Message: Identifier name '%s' is too long

- Error: 1060 SQLSTATE: 42S21 (ER\_DUP\_FIELDNAME)

Message: Duplicate column name '%s'

- Error: 1061 SQLSTATE: 42000 (ER\_DUP\_KEYNAME)  
Message: Duplicate key name '%s'
- Error: 1062 SQLSTATE: 23000 (ER\_DUP\_ENTRY)  
Message: Duplicate entry '%s' for key %d  
The message returned with this error uses the format string for ER\_DUP\_ENTRY\_WITH\_KEY\_NAME.
- Error: 1063 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_SPEC)  
Message: Incorrect column specifier for column '%s'
- Error: 1064 SQLSTATE: 42000 (ER\_PARSE\_ERROR)  
Message: %s near '%s' at line %d
- Error: 1065 SQLSTATE: 42000 (ER\_EMPTY\_QUERY)  
Message: Query was empty
- Error: 1066 SQLSTATE: 42000 (ER\_NONUNIQ\_TABLE)  
Message: Not unique table/alias: '%s'
- Error: 1067 SQLSTATE: 42000 (ER\_INVALID\_DEFAULT)  
Message: Invalid default value for '%s'
- Error: 1068 SQLSTATE: 42000 (ER\_MULTIPLE\_PRI\_KEY)  
Message: Multiple primary key defined
- Error: 1069 SQLSTATE: 42000 (ER\_TOO\_MANY\_KEYS)  
Message: Too many keys specified; max %d keys allowed
- Error: 1070 SQLSTATE: 42000 (ER\_TOO\_MANY\_KEY\_PARTS)  
Message: Too many key parts specified; max %d parts allowed
- Error: 1071 SQLSTATE: 42000 (ER\_TOO\_LONG\_KEY)  
Message: Specified key was too long; max key length is %d bytes
- Error: 1072 SQLSTATE: 42000 (ER\_KEY\_COLUMN\_DOES\_NOT\_EXITS)  
Message: Key column '%s' doesn't exist in table
- Error: 1073 SQLSTATE: 42000 (ER\_BLOB\_USED\_AS\_KEY)  
Message: BLOB column '%s' can't be used in key specification with the used table type
- Error: 1074 SQLSTATE: 42000 (ER\_TOO\_BIG\_FIELDLENGTH)  
Message: Column length too big for column '%s' (max = %lu); use BLOB or TEXT instead
- Error: 1075 SQLSTATE: 42000 (ER\_WRONG\_AUTO\_KEY)  
Message: Incorrect table definition; there can be only one auto column and it must be defined as a key
- Error: 1076 SQLSTATE: HY000 (ER\_READY)

Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error: 1077 SQLSTATE: HY000 (ER\_NORMAL\_SHUTDOWN)

Message: %s: Normal shutdown

- Error: 1078 SQLSTATE: HY000 (ER\_GOT\_SIGNAL)

Message: %s: Got signal %d. Aborting!

- Error: 1079 SQLSTATE: HY000 (ER\_SHUTDOWN\_COMPLETE)

Message: %s: Shutdown complete

- Error: 1080 SQLSTATE: 08S01 (ER\_FORCING\_CLOSE)

Message: %s: Forcing close of thread %ld user: '%s'

- Error: 1081 SQLSTATE: 08S01 (ER\_IPSOCKET\_ERROR)

Message: Can't create IP socket

- Error: 1082 SQLSTATE: 42S12 (ER\_NO\_SUCH\_INDEX)

Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table

- Error: 1083 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_TERMINATORS)

Message: Field separator argument is not what is expected; check the manual

- Error: 1084 SQLSTATE: 42000 (ER\_BLOBS\_AND\_NO\_TERMINATED)

Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'

- Error: 1085 SQLSTATE: HY000 (ER\_TEXTFILE\_NOT\_READABLE)

Message: The file '%s' must be in the database directory or be readable by all

- Error: 1086 SQLSTATE: HY000 (ER\_FILE\_EXISTS\_ERROR)

Message: File '%s' already exists

- Error: 1087 SQLSTATE: HY000 (ER\_LOAD\_INFO)

Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld

- Error: 1088 SQLSTATE: HY000 (ER\_ALTER\_INFO)

Message: Records: %ld Duplicates: %ld

- Error: 1089 SQLSTATE: HY000 (ER\_WRONG\_SUB\_KEY)

Message: Incorrect prefix key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique prefix keys

- Error: 1090 SQLSTATE: 42000 (ER\_CANT\_REMOVE\_ALL\_FIELDS)

Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead

- Error: 1091 SQLSTATE: 42000 (ER\_CANT\_DROP\_FIELD\_OR\_KEY)

Message: Can't DROP '%s'; check that column/key exists

- Error: 1092 SQLSTATE: HY000 (ER\_INSERT\_INFO)

Message: Records: %ld Duplicates: %ld Warnings: %ld

- Error: 1093 SQLSTATE: HY000 (ER\_UPDATE\_TABLE\_USED)

Message: You can't specify target table '%s' for update in FROM clause

This error occurs for attempts to select from and modify the same table within a single statement. If the select attempt occurs within a derived table, you can avoid this error by setting the `derived_merge` flag of the `optimizer_switch` system variable to force the subquery to be materialized into a temporary table, which effectively causes it to be a different table from the one modified. See [Section 8.2.2.3, "Optimizing Derived Tables and View References"](#).

- Error: 1094 SQLSTATE: HY000 (ER\_NO\_SUCH\_THREAD)

Message: Unknown thread id: %lu

- Error: 1095 SQLSTATE: HY000 (ER\_KILL\_DENIED\_ERROR)

Message: You are not owner of thread %lu

- Error: 1096 SQLSTATE: HY000 (ER\_NO\_TABLES\_USED)

Message: No tables used

- Error: 1097 SQLSTATE: HY000 (ER\_TOO\_BIG\_SET)

Message: Too many strings for column %s and SET

- Error: 1098 SQLSTATE: HY000 (ER\_NO\_UNIQUE\_LOGFILE)

Message: Can't generate a unique log-filename %s.(1-999)

- Error: 1099 SQLSTATE: HY000 (ER\_TABLE\_NOT\_LOCKED\_FOR\_WRITE)

Message: Table '%s' was locked with a READ lock and can't be updated

- Error: 1100 SQLSTATE: HY000 (ER\_TABLE\_NOT\_LOCKED)

Message: Table '%s' was not locked with LOCK TABLES

- Error: 1101 SQLSTATE: 42000 (ER\_BLOB\_CANT\_HAVE\_DEFAULT)

Message: BLOB, TEXT, GEOMETRY or JSON column '%s' can't have a default value

- Error: 1102 SQLSTATE: 42000 (ER\_WRONG\_DB\_NAME)

Message: Incorrect database name '%s'

- Error: 1103 SQLSTATE: 42000 (ER\_WRONG\_TABLE\_NAME)

Message: Incorrect table name '%s'

- Error: 1104 SQLSTATE: 42000 (ER\_TOO\_BIG\_SELECT)

Message: The SELECT would examine more than MAX\_JOIN\_SIZE rows; check your WHERE and use SET SQL\_BIG\_SELECTS=1 or SET MAX\_JOIN\_SIZE=# if the SELECT is okay

- Error: 1105 SQLSTATE: HY000 (ER\_UNKNOWN\_ERROR)

Message: Unknown error

- Error: 1106 SQLSTATE: 42000 (ER\_UNKNOWN\_PROCEDURE)

Message: Unknown procedure '%s'

- Error: 1107 SQLSTATE: 42000 (ER\_WRONG\_PARAMCOUNT\_TO\_PROCEDURE)  
Message: Incorrect parameter count to procedure '%s'
- Error: 1108 SQLSTATE: HY000 (ER\_WRONG\_PARAMETERS\_TO\_PROCEDURE)  
Message: Incorrect parameters to procedure '%s'
- Error: 1109 SQLSTATE: 42S02 (ER\_UNKNOWN\_TABLE)  
Message: Unknown table '%s' in %s
- Error: 1110 SQLSTATE: 42000 (ER\_FIELD\_SPECIFIED\_TWICE)  
Message: Column '%s' specified twice
- Error: 1111 SQLSTATE: HY000 (ER\_INVALID\_GROUP\_FUNC\_USE)  
Message: Invalid use of group function
- Error: 1112 SQLSTATE: 42000 (ER\_UNSUPPORTED\_EXTENSION)  
Message: Table '%s' uses an extension that doesn't exist in this MySQL version
- Error: 1113 SQLSTATE: 42000 (ER\_TABLE\_MUST\_HAVE\_COLUMNS)  
Message: A table must have at least 1 column
- Error: 1114 SQLSTATE: HY000 (ER\_RECORD\_FILE\_FULL)  
Message: The table '%s' is full  
  
InnoDB reports this error when the system tablespace runs out of free space. Reconfigure the system tablespace to add a new data file.
- Error: 1115 SQLSTATE: 42000 (ER\_UNKNOWN\_CHARACTER\_SET)  
Message: Unknown character set: '%s'
- Error: 1116 SQLSTATE: HY000 (ER\_TOO\_MANY\_TABLES)  
Message: Too many tables; MySQL can only use %d tables in a join
- Error: 1117 SQLSTATE: HY000 (ER\_TOO\_MANY\_FIELDS)  
Message: Too many columns
- Error: 1118 SQLSTATE: 42000 (ER\_TOO\_BIG\_ROWSIZE)  
Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. This includes storage overhead, check the manual. You have to change some columns to TEXT or BLOBs
- Error: 1119 SQLSTATE: HY000 (ER\_STACK\_OVERRUN)  
Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld --thread\_stack=#' to specify a bigger stack if needed
- Error: 1120 SQLSTATE: 42000 (ER\_WRONG\_OUTER\_JOIN)  
Message: Cross dependency found in OUTER JOIN; examine your ON conditions
- Error: 1121 SQLSTATE: 42000 (ER\_NULL\_COLUMN\_IN\_INDEX)

Message: Table handler doesn't support NULL in given index. Please change column '%s' to be NOT NULL or use another handler

- Error: 1122 SQLSTATE: HY000 (ER\_CANT\_FIND\_UDF)

Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER\_CANT\_INITIALIZE\_UDF)

Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER\_UDF\_NO\_PATHS)

Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER\_UDF\_EXISTS)

Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER\_CANT\_OPEN\_LIBRARY)

Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER\_CANT\_FIND\_DL\_ENTRY)

Message: Can't find symbol '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER\_FUNCTION\_NOT\_DEFINED)

Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER\_HOST\_IS\_BLOCKED)

Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER\_HOST\_NOT\_PRIVILEGED)

Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER\_PASSWORD\_ANONYMOUS\_USER)

Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER\_PASSWORD\_NOT\_ALLOWED)

Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER\_PASSWORD\_NO\_MATCH)

Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER\_UPDATE\_INFO)

Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER\_CANT\_CREATE\_THREAD)

Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER\_WRONG\_VALUE\_COUNT\_ON\_ROW)

Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER\_CANT\_REOPEN\_TABLE)

Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 22004 (ER\_INVALID\_USE\_OF\_NULL)

Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER\_REGEX\_ERROR)

Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER\_MIX\_OF\_GROUP\_FUNC\_AND\_FIELDS)

Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER\_NONEXISTING\_GRANT)

Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER\_TABLEACCESS\_DENIED\_ERROR)

Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER\_COLUMNACCESS\_DENIED\_ERROR)

Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER\_ILLEGAL\_GRANT\_FOR\_TABLE)

Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER\_GRANT\_WRONG\_HOST\_OR\_USER)

Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER\_NO\_SUCH\_TABLE)

Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER\_NONEXISTING\_TABLE\_GRANT)

Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER\_NOT\_ALLOWED\_COMMAND)

Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER\_SYNTAX\_ERROR)

Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER\_UNUSED1)

Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER\_UNUSED2)

Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER\_ABORTING\_CONNECTION)  
Message: Aborted connection %ld to db: '%s' user: '%s' (%s)
- Error: 1153 SQLSTATE: 08S01 (ER\_NET\_PACKET\_TOO\_LARGE)

- Error: 1154 SQLSTATE: 08S01 (ER\_NET\_READ\_ERROR\_FROM\_PIPE)  
Message: Got a read error from the connection pipe
- Error: 1155 SQLSTATE: 08S01 (ER\_NET\_FCNTL\_ERROR)  
Message: Got an error from fcntl()
- Error: 1156 SQLSTATE: 08S01 (ER\_NET\_PACKETS\_OUT\_OF\_ORDER)  
Message: Got packets out of order
- Error: 1157 SQLSTATE: 08S01 (ER\_NET\_UNCOMPRESS\_ERROR)  
Message: Couldn't uncompress communication packet
- Error: 1158 SQLSTATE: 08S01 (ER\_NET\_READ\_ERROR)  
Message: Got an error reading communication packets
- Error: 1159 SQLSTATE: 08S01 (ER\_NET\_READ\_INTERRUPTED)  
Message: Got timeout reading communication packets
- Error: 1160 SQLSTATE: 08S01 (ER\_NET\_ERROR\_ON\_WRITE)  
Message: Got an error writing communication packets
- Error: 1161 SQLSTATE: 08S01 (ER\_NET\_WRITE\_INTERRUPTED)  
Message: Got timeout writing communication packets
- Error: 1162 SQLSTATE: 42000 (ER\_TOO\_LONG\_STRING)  
Message: Result string is longer than 'max\_allowed\_packet' bytes
- Error: 1163 SQLSTATE: 42000 (ER\_TABLE\_CANT\_HANDLE\_BLOB)  
Message: The used table type doesn't support BLOB/TEXT columns
- Error: 1164 SQLSTATE: 42000 (ER\_TABLE\_CANT\_HANDLE\_AUTO\_INCREMENT)  
Message: The used table type doesn't support AUTO\_INCREMENT columns
- Error: 1165 SQLSTATE: HY000 (ER\_UNUSED3)  
Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
- Error: 1166 SQLSTATE: 42000 (ER\_WRONG\_COLUMN\_NAME)  
Message: Incorrect column name '%s'
- Error: 1167 SQLSTATE: 42000 (ER\_WRONG\_KEY\_COLUMN)  
Message: The used storage engine can't index column '%s'
- Error: 1168 SQLSTATE: HY000 (ER\_WRONG\_MRG\_TABLE)

Message: Unable to open underlying table which is differently defined or of non-MyISAM type or doesn't exist

- Error: 1169 SQLSTATE: 23000 (ER\_DUP\_UNIQUE)

Message: Can't write, because of unique constraint, to table '%s'

- Error: 1170 SQLSTATE: 42000 (ER\_BLOB\_KEY\_WITHOUT\_LENGTH)

Message: BLOB/TEXT column '%s' used in key specification without a key length

- Error: 1171 SQLSTATE: 42000 (ER\_PRIMARY\_CANT\_HAVE\_NULL)

Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead

- Error: 1172 SQLSTATE: 42000 (ER\_TOO\_MANY\_ROWS)

Message: Result consisted of more than one row

- Error: 1173 SQLSTATE: 42000 (ER\_REQUIRES\_PRIMARY\_KEY)

Message: This table type requires a primary key

- Error: 1174 SQLSTATE: HY000 (ER\_NO\_RAID\_COMPILED)

Message: This version of MySQL is not compiled with RAID support

- Error: 1175 SQLSTATE: HY000 (ER\_UPDATE\_WITHOUT\_KEY\_IN\_SAFE\_MODE)

Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column. %s

- Error: 1176 SQLSTATE: 42000 (ER\_KEY\_DOES\_NOT\_EXISTS)

Message: Key '%s' doesn't exist in table '%s'

- Error: 1177 SQLSTATE: 42000 (ER\_CHECK\_NO\_SUCH\_TABLE)

Message: Can't open table

- Error: 1178 SQLSTATE: 42000 (ER\_CHECK\_NOT\_IMPLEMENTED)

Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER\_CANT\_DO\_THIS\_DURING\_AN\_TRANSACTION)

Message: You are not allowed to execute this command in a transaction

- Error: 1180 SQLSTATE: HY000 (ER\_ERROR\_DURING\_COMMIT)

Message: Got error %d during COMMIT

- Error: 1181 SQLSTATE: HY000 (ER\_ERROR\_DURING\_ROLLBACK)

- Error: 1185 SQLSTATE: HY000 ([ER\\_DUMP\\_NOT\\_IMPLEMENTED](#))  
Message: The storage engine for the table does not support binary table dump
- Error: 1186 SQLSTATE: HY000 ([ER\\_FLUSH\\_MASTER\\_BINLOG\\_CLOSED](#))  
Message: Binlog closed, cannot RESET MASTER
- Error: 1187 SQLSTATE: HY000 ([ER\\_INDEX\\_REBUILD](#))  
Message: Failed rebuilding the index of dumped table '%s'
- Error: 1188 SQLSTATE: HY000 ([ER\\_MASTER](#))  
Message: Error from master: '%s'
- Error: 1189 SQLSTATE: 08S01 ([ER\\_MASTER\\_NET\\_READ](#))  
Message: Net error reading from master
- Error: 1190 SQLSTATE: 08S01 ([ER\\_MASTER\\_NET\\_WRITE](#))  
Message: Net error writing to master
- Error: 1191 SQLSTATE: HY000 ([ER\\_FT\\_MATCHING\\_KEY\\_NOT\\_FOUND](#))  
Message: Can't find FULLTEXT index matching the column list
- Error: 1192 SQLSTATE: HY000 ([ER\\_LOCK\\_OR\\_ACTIVE\\_TRANSACTION](#))  
Message: Can't execute the given command because you have active locked tables or an active transaction
- Error: 1193 SQLSTATE: HY000 ([ER\\_UNKNOWN\\_SYSTEM\\_VARIABLE](#))  
Message: Unknown system variable '%s'
- Error: 1194 SQLSTATE: HY000 ([ER\\_CRASHED\\_ON\\_USAGE](#))  
Message: Table '%s' is marked as crashed and should be repaired
- Error: 1195 SQLSTATE: HY000 ([ER\\_CRASHED\\_ON\\_REPAIR](#))  
Message: Table '%s' is marked as crashed and last (automatic?) repair failed
- Error: 1196 SQLSTATE: HY000 ([ER\\_WARNING\\_NOT\\_COMPLETE\\_ROLLBACK](#))  
Message: Some non-transactional changed tables couldn't be rolled back
- Error: 1197 SQLSTATE: HY000 ([ER\\_TRANS\\_CACHE\\_FULL](#))  
Message: Multi-statement transaction required more than 'max\_binlog\_cache\_size' bytes of storage; increase this mysqld variable and try again
- Error: 1198 SQLSTATE: HY000 ([ER\\_SLAVE\\_MUST\\_STOP](#))  
Message: This operation cannot be performed with a running slave; run STOP SLAVE first
- Error: 1199 SQLSTATE: HY000 ([ER\\_SLAVE\\_NOT\\_RUNNING](#))  
Message: This operation requires a running slave; configure slave and do START SLAVE

- Error: 1200 SQLSTATE: HY000 (ER\_BAD\_SLAVE)  
 Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO
- Error: 1201 SQLSTATE: HY000 (ER\_MASTER\_INFO)  
 Message: Could not initialize master info structure; more error messages can be found in the MySQL error log
- Error: 1202 SQLSTATE: HY000 (ER\_SLAVE\_THREAD)  
 Message: Could not create slave thread; check system resources
- Error: 1203 SQLSTATE: 42000 (ER\_TOO\_MANY\_USER\_CONNECTIONS)  
 Message: User %s already has more than 'max\_user\_connections' active connections
- Error: 1204 SQLSTATE: HY000 (ER\_SET\_CONSTANTS\_ONLY)  
 Message: You may only use constant expressions with SET
- Error: 1205 SQLSTATE: HY000 (ER\_LOCK\_WAIT\_TIMEOUT)  
 Message: Lock wait timeout exceeded; try restarting transaction  
  
 InnoDB reports this error when lock wait timeout expires. The statement that waited too long was **rolled back** (not the entire **transaction**). You can increase the value of the `innodb_lock_wait_timeout` configuration option if SQL statements should wait longer for other transactions to complete, or decrease it if too many long-running transactions are causing **locking** problems and reducing **concurrency** on a busy system.
- Error: 1206 SQLSTATE: HY000 (ER\_LOCK\_TABLE\_FULL)  
 Message: The total number of locks exceeds the lock table size  
  
 InnoDB reports this error when the total number of locks exceeds the amount of memory devoted to managing locks. To avoid this error, increase the value of `innodb_buffer_pool_size`. Within an individual application, a workaround may be to break a large operation into smaller pieces. For example, if the error occurs for a large **INSERT**, perform several smaller **INSERT** operations.
- Error: 1207 SQLSTATE: 25000 (ER\_READ\_ONLY\_TRANSACTION)  
 Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction
- Error: 1208 SQLSTATE: HY000 (ER\_DROP\_DB\_WITH\_READ\_LOCK)  
 Message: DROP DATABASE not allowed while thread is holding global read lock
- Error: 1209 SQLSTATE: HY000 (ER\_CREATE\_DB\_WITH\_READ\_LOCK)  
 Message: CREATE DATABASE not allowed while thread is holding global read lock
- Error: 1210 SQLSTATE: HY000 (ER\_WRONG\_ARGUMENTS)  
 Message: Incorrect arguments to %s
- Error: 1211 SQLSTATE: 42000 (ER\_NO\_PERMISSION\_TO\_CREATE\_USER)  
 Message: '%s'@'%s' is not allowed to create new users
- Error: 1212 SQLSTATE: HY000 (ER\_UNION\_TABLES\_IN\_DIFFERENT\_DIR)  
 Message: Incorrect table definition; all MERGE tables must be in the same database

- Error: 1213 SQLSTATE: 40001 (ER\_LOCK\_DEADLOCK)

Message: Deadlock found when trying to get lock; try restarting transaction

InnoDB reports this error when a [transaction](#) encounters a [deadlock](#) and is automatically [rolled back](#) so that your application can take corrective action. To recover from this error, run all the operations in this transaction again. A deadlock occurs when requests for locks arrive in inconsistent order between transactions. The transaction that was rolled back released all its locks, and the other transaction can now get all the locks it requested. Thus, when you re-run the transaction that was rolled back, it might have to wait for other transactions to complete, but typically the deadlock does not recur. If you encounter frequent deadlocks, make the sequence of locking operations ([LOCK TABLES](#), [SELECT ... FOR UPDATE](#), and so on) consistent between the different transactions or applications that experience the issue. See [Section 14.5.5, "Deadlocks in InnoDB"](#) for details.

- Error: 1214 SQLSTATE: HY000 (ER\_TABLE\_CANT\_HANDLE\_FT)

Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER\_CANNOT\_ADD\_FOREIGN)

Message: Cannot add foreign key constraint

- Error: 1216 SQLSTATE: 23000 (ER\_NO\_REFERENCED\_ROW)

Message: Cannot add or update a child row: a foreign key constraint fails

InnoDB reports this error when you try to add a row but there is no parent row, and a [foreign key constraint](#) fails. Add the parent row first.

- Error: 1217 SQLSTATE: 23000 (ER\_ROW\_IS\_REFERENCED)

Message: Cannot delete or update a parent row: a foreign key constraint fails

InnoDB reports this error when you try to delete a parent row that has children, and a [foreign key constraint](#) fails. Delete the children first.

- Error: 1218 SQLSTATE: 08S01 (ER\_CONNECT\_TO\_MASTER)

Message: Error connecting to master: %s

- Error: 1219 SQLSTATE: HY000 (ER\_QUERY\_ON\_MASTER)

- Error: 1235 SQLSTATE: 42000 (ER\_NOT\_SUPPORTED\_YET)  
Message: This version of MySQL doesn't yet support '%s'
- Error: 1236 SQLSTATE: HY000 (ER\_MASTER\_FATAL\_ERROR\_READING\_BINLOG)  
Message: Got fatal error %d from master when reading data from binary log: '%s'
- Error: 1237 SQLSTATE: HY000 (ER\_SLAVE\_IGNORED\_TABLE)  
Message: Slave SQL thread ignored the query because of replicate-\*-table rules
- Error: 1238 SQLSTATE: HY000 (ER\_INCORRECT\_GLOBAL\_LOCAL\_VAR)  
Message: Variable '%s' is a %s variable
- Error: 1239 SQLSTATE: 42000 (ER\_WRONG\_FK\_DEF)  
Message: Incorrect foreign key definition for '%s': %s
- Error: 1240 SQLSTATE: HY000 (ER\_KEY\_REF\_DO\_NOT\_MATCH\_TABLE\_REF)  
Message: Key reference and table reference don't match
- Error: 1241 SQLSTATE: 21000 (ER\_OPERAND\_COLUMNS)

Message: Operand should contain %d column(s)

- Error: 1242 SQLSTATE: 21000 (ER\_SUBQUERY\_NO\_1\_ROW)

Message: Subquery returns more than 1 row

- Error: 1243 SQLSTATE: HY000 (ER\_UNKNOWN\_STMT\_HANDLER)

Message: Unknown prepared statement handler (%.\*s) given to %s

- Error: 1244 SQLSTATE: HY000 (ER\_CORRUPT\_HELP\_DB)

Message: Help database is corrupt or does not exist

- Error: 1245 SQLSTATE: HY000 (ER\_CYCLIC\_REFERENCE)

Message: Cyclic reference on subqueries

- Error: 1246 SQLSTATE: HY000 (ER\_AUTO\_CONVERT)

Message: Converting column '%s' from %s to %s

- Error: 1247 SQLSTATE: 42S22 (ER\_ILLEGAL\_REFERENCE)

Message: Reference '%s' not supported (%s)

- Error: 1248 SQLSTATE: 42000 (ER\_DERIVED\_MUST\_HAVE\_ALIAS)

Message: Every derived table must have its own alias

- Error: 1249 SQLSTATE: 01000 (ER\_SELECT\_REDUCED)

Message: Select %u was reduced during optimization

- Error: 1250 SQLSTATE: 42000 (ER\_TABLENAME\_NOT\_ALLOWED\_HERE)

Message: Table '%s' from one of the SELECTs cannot be used in %s

- Error: 1251 SQLSTATE: 08004 (ER\_NOT\_SUPPORTED\_AUTH\_MODE)

Message: Client does not support authentication protocol requested by server; consider upgrading MySQL client

- Error: 1252 SQLSTATE: 42000 (ER\_SPATIAL\_CANT\_HAVE\_NULL)

Message: All parts of a SPATIAL index must be NOT NULL

- Error: 1253 SQLSTATE: 42000 (ER\_COLLATION\_CHARSET\_MISMATCH)

Message: COLLATION '%s' is not valid for CHARACTER SET '%s'

- Error: 1254 SQLSTATE: HY000 (ER\_SLAVE\_WAS\_RUNNING)

Message: Slave is already running

- Error: 1255 SQLSTATE: HY000 (ER\_SLAVE\_WAS\_NOT\_RUNNING)

Message: Slave already has been stopped

- Error: 1256 SQLSTATE: HY000 (ER\_TOO\_BIG\_FOR\_UNCOMPRESS)

Message: Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)

- Error: 1257 SQLSTATE: HY000 (ER\_ZLIB\_Z\_MEM\_ERROR)  
Message: ZLIB: Not enough memory
- Error: 1258 SQLSTATE: HY000 (ER\_ZLIB\_Z\_BUF\_ERROR)  
Message: ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
- Error: 1259 SQLSTATE: HY000 (ER\_ZLIB\_Z\_DATA\_ERROR)  
Message: ZLIB: Input data corrupted
- Error: 1260 SQLSTATE: HY000 (ER\_CUT\_VALUE\_GROUP\_CONCAT)  
Message: Row %u was cut by GROUP\_CONCAT()
- Error: 1261 SQLSTATE: 01000 (ER\_WARN\_TOO\_FEW\_RECORDS)  
Message: Row %ld doesn't contain data for all columns
- Error: 1262 SQLSTATE: 01000 (ER\_WARN\_TOO\_MANY\_RECORDS)  
Message: Row %ld was truncated; it contained more data than there were input columns
- Error: 1263 SQLSTATE: 22004 (ER\_WARN\_NULL\_TO\_NOTNULL)  
Message: Column set to default value; NULL supplied to NOT NULL column '%s' at row %ld
- Error: 1264 SQLSTATE: 22003 (ER\_WARN\_DATA\_OUT\_OF\_RANGE)  
Message: Out of range value for column '%s' at row %ld
- Error: 1265 SQLSTATE: 01000 (WARN\_DATA\_TRUNCATED)  
Message: Data truncated for column '%s' at row %ld
- Error: 1266 SQLSTATE: HY000 (ER\_WARN\_USING\_OTHER\_HANDLER)  
Message: Using storage engine %s for table '%s'
- Error: 1267 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_2COLLATIONS)  
Message: Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'
- Error: 1268 SQLSTATE: HY000 (ER\_DROP\_USER)  
Message: Cannot drop one or more of the requested users
- Error: 1269 SQLSTATE: HY000 (ER\_REVOKE\_GRANTS)  
Message: Can't revoke all privileges for one or more of the requested users
- Error: 1270 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_3COLLATIONS)  
Message: Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'
- Error: 1271 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_NCOLLATIONS)  
Message: Illegal mix of collations for operation '%s'
- Error: 1272 SQLSTATE: HY000 (ER\_VARIABLE\_IS\_NOT\_STRUCT)  
Message: Variable '%s' is not a variable component (can't be used as XXXX.variable\_name)

- Error: 1273 SQLSTATE: HY000 (ER\_UNKNOWN\_COLLATION)  
Message: Unknown collation: '%s'
- Error: 1274 SQLSTATE: HY000 (ER\_SLAVE\_IGNORED\_SSL\_PARAMS)  
Message: SSL parameters in CHANGE MASTER are ignored because this MySQL slave was compiled without SSL support; they can be used later if MySQL slave with SSL is started
- Error: 1275 SQLSTATE: HY000 (ER\_SERVER\_IS\_IN\_SECURE\_AUTH\_MODE)  
Message: Server is running in --secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format
- Error: 1276 SQLSTATE: HY000 (ER\_WARN\_FIELD\_RESOLVED)  
Message: Field or reference '%s%s%s%s%s' of SELECT #%d was resolved in SELECT #%d
- Error: 1277 SQLSTATE: HY000 (ER\_BAD\_SLAVE\_UNTIL\_COND)  
Message: Incorrect parameter or combination of parameters for START SLAVE UNTIL
- Error: 1278 SQLSTATE: HY000 (ER\_MISSING\_SKIP\_SLAVE)  
Message: It is recommended to use --skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart
- Error: 1279 SQLSTATE: HY000 (ER\_UNTIL\_COND\_IGNORED)  
Message: SQL thread is not to be started so UNTIL options are ignored
- Error: 1280 SQLSTATE: 42000 (ER\_WRONG\_NAME\_FOR\_INDEX)  
Message: Incorrect index name '%s'
- Error: 1281 SQLSTATE: 42000 (ER\_WRONG\_NAME\_FOR\_CATALOG)  
Message: Incorrect catalog name '%s'
- Error: 1282 SQLSTATE: HY000 (ER\_WARN\_QC\_RESIZE)  
Message: Query cache failed to set size %lu; new query cache size is %lu
- Error: 1283 SQLSTATE: HY000 (ER\_BAD\_FT\_COLUMN)  
Message: Column '%s' cannot be part of FULLTEXT index
- Error: 1284 SQLSTATE: HY000 (ER\_UNKNOWN\_KEY\_CACHE)  
Message: Unknown key cache '%s'
- Error: 1285 SQLSTATE: HY000 (ER\_WARN\_HOSTNAME\_WONT\_WORK)  
Message: MySQL is started in --skip-name-resolve mode; you must restart it without this switch for this grant to work
- Error: 1286 SQLSTATE: 42000 (ER\_UNKNOWN\_STORAGE\_ENGINE)  
Message: Unknown storage engine '%s'
- Error: 1287 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SYNTAX)  
Message: '%s' is deprecated and will be removed in a future release. Please use %s instead

- Error: 1288 SQLSTATE: HY000 (ER\_NON\_UPDATABLE\_TABLE)  
Message: The target table %s of the %s is not updatable
- Error: 1289 SQLSTATE: HY000 (ER\_FEATURE\_DISABLED)  
Message: The '%s' feature is disabled; you need MySQL built with '%s' to have it working
- Error: 1290 SQLSTATE: HY000 (ER\_OPTION\_PREVENTS\_STATEMENT)  
Message: The MySQL server is running with the %s option so it cannot execute this statement
- Error: 1291 SQLSTATE: HY000 (ER\_DUPLICATED\_VALUE\_IN\_TYPE)  
Message: Column '%s' has duplicated value '%s' in %s
- Error: 1292 SQLSTATE: 22007 (ER\_TRUNCATED\_WRONG\_VALUE)  
Message: Truncated incorrect %s value: '%s'
- Error: 1293 SQLSTATE: HY000 (ER\_TOO\_MUCH\_AUTO\_TIMESTAMP\_COLS)  
Message: Incorrect table definition; there can be only one TIMESTAMP column with CURRENT\_TIMESTAMP in DEFAULT or ON UPDATE clause
- Error: 1294 SQLSTATE: HY000 (ER\_INVALID\_ON\_UPDATE)  
Message: Invalid ON UPDATE clause for '%s' column
- Error: 1295 SQLSTATE: HY000 (ER\_UNSUPPORTED\_PS)  
Message: This command is not supported in the prepared statement protocol yet
- Error: 1296 SQLSTATE: HY000 (ER\_GET\_ERRMSG)  
Message: Got error %d '%s' from %s
- Error: 1297 SQLSTATE: HY000 (ER\_GET\_TEMPORARY\_ERRMSG)  
Message: Got temporary error %d '%s' from %s
- Error: 1298 SQLSTATE: HY000 (ER\_UNKNOWN\_TIME\_ZONE)  
Message: Unknown or incorrect time zone: '%s'
- Error: 1299 SQLSTATE: HY000 (ER\_WARN\_INVALID\_TIMESTAMP)  
Message: Invalid TIMESTAMP value in column '%s' at row %ld
- Error: 1300 SQLSTATE: HY000 (ER\_INVALID\_CHARACTER\_STRING)  
Message: Invalid %s character string: '%s'
- Error: 1301 SQLSTATE: HY000 (ER\_WARN\_ALLOWED\_PACKET\_OVERFLOWED)  
Message: Result of %s() was larger than max\_allowed\_packet (%ld) - truncated
- Error: 1302 SQLSTATE: HY000 (ER\_CONFLICTING\_DECLARATIONS)  
Message: Conflicting declarations: '%s%s' and '%s%s'
- Error: 1303 SQLSTATE: 2F003 (ER\_SP\_NO\_RECURSIVE\_CREATE)  
Message: Can't create a %s from within another stored routine

- Error: 1304 SQLSTATE: 42000 (ER\_SP\_ALREADY\_EXISTS)  
Message: %s %s already exists
- Error: 1305 SQLSTATE: 42000 (ER\_SP\_DOES\_NOT\_EXIST)

Message: Failed to ALTER %s %s
- Error: 1335 SQLSTATE: 0A000 (ER\_SP\_SUBSELECT\_NYI)  
Message: Subquery value not supported
- Error: 1336 SQLSTATE: 0A000 (ER\_STMT\_NOT\_ALLOWED\_IN\_SF\_OR\_TRG)

Message: %s is not allowed in stored function or trigger

- Error: 1337 SQLSTATE: 42000 (ER\_SP\_VARCOND\_AFTER\_CURSHNDLR)

Message: Variable or condition declaration after cursor or handler declaration

- Error: 1338 SQLSTATE: 42000 (ER\_SP\_CURSOR\_AFTER\_HANDLER)

Message: Cursor declaration after handler declaration

- Error: 1339 SQLSTATE: 20000 (ER\_SP\_CASE\_NOT\_FOUND)

Message: Case not found for CASE statement

- Error: 1340 SQLSTATE: HY000 (ER\_FPARSER\_TOO\_BIG\_FILE)

Message: Configuration file '%s' is too big

- Error: 1341 SQLSTATE: HY000 (ER\_FPARSER\_BAD\_HEADER)

Message: Malformed file type header in file '%s'

- Error: 1342 SQLSTATE: HY000 (ER\_FPARSER\_EOF\_IN\_COMMENT)

Message: Unexpected end of file while parsing comment '%s'

- Error: 1343 SQLSTATE: HY000 (ER\_FPARSER\_ERROR\_IN\_PARAMETER)

Message: Error while parsing parameter '%s' (line: '%s')

- Error: 1344 SQLSTATE: HY000 (ER\_FPARSER\_EOF\_IN\_UNKNOWN\_PARAMETER)

Message: Unexpected end of file while skipping unknown parameter '%s'

- Error: 1345 SQLSTATE: HY000 (ER\_VIEW\_NO\_EXPLAIN)

Message: EXPLAIN/SHOW can not be issued; lacking privileges for underlying table

- Error: 1346 SQLSTATE: HY000 (ER\_FRM\_UNKNOWN\_TYPE)

Message: File '%s' has unknown type '%s' in its header

- Error: 1347 SQLSTATE: HY000 (ER\_WRONG\_OBJECT)

Message: '%s.%s' is not %s

The named object is incorrect for the type of operation attempted on it. It must be an object of the named type.

- Error: 1348 SQLSTATE: HY000 (ER\_NONUPDATEABLE\_COLUMN)

Message: Column '%s' is not updatable

- Error: 1349 SQLSTATE: HY000 (ER\_VIEW\_SELECT\_DERIVED)

Message: View's SELECT contains a subquery in the FROM clause

ER\_VIEW\_SELECT\_DERIVED was removed after 5.7.6.

- Error: 1349 SQLSTATE: HY000 (ER\_VIEW\_SELECT\_DERIVED\_UNUSED)

Message: View's SELECT contains a subquery in the FROM clause

ER\_VIEW\_SELECT\_DERIVED\_UNUSED was added in 5.7.7.

- Error: 1350 SQLSTATE: HY000 (ER\_VIEW\_SELECT\_CLAUSE)  
Message: View's SELECT contains a '%s' clause
- Error: 1351 SQLSTATE: HY000 (ER\_VIEW\_SELECT\_VARIABLE)  
Message: View's SELECT contains a variable or parameter
- Error: 1352 SQLSTATE: HY000 (ER\_VIEW\_SELECT\_TMPTABLE)  
Message: View's SELECT refers to a temporary table '%s'
- Error: 1353 SQLSTATE: HY000 (ER\_VIEW\_WRONG\_LIST)  
Message: View's SELECT and view's field list have different column counts
- Error: 1354 SQLSTATE: HY000 (ER\_WARN\_VIEW\_MERGE)  
Message: View merge algorithm can't be used here for now (assumed undefined algorithm)
- Error: 1355 SQLSTATE: HY000 (ER\_WARN\_VIEW\_WITHOUT\_KEY)  
Message: View being updated does not have complete key of underlying table in it
- Error: 1356 SQLSTATE: HY000 (ER\_VIEW\_INVALID)  
Message: View '%s.%s' references invalid table(s) or column(s) or function(s) or definer invoker of view lack rights to use them
- Error: 1357 SQLSTATE: HY000 (ER\_SP\_NO\_DROP\_SP)  
Message: Can't drop or alter a %s from within another stored routine
- Error: 1358 SQLSTATE: HY000 (ER\_SP\_GOTO\_IN\_HNDLR)  
Message: GOTO is not allowed in a stored procedure handler
- Error: 1359 SQLSTATE: HY000 (ER\_TRG\_ALREADY\_EXISTS)

- Error: 1416 SQLSTATE: 22003 (ER\_CANT\_CREATE\_GEOMETRY\_OBJECT)  
 Message: Cannot get geometry object from data you send to the GEOMETRY field
- Error: 1417 SQLSTATE: HY000 (ER\_FAILED\_ROUTINE\_BREAK\_BINLOG)  
 Message: A routine failed and has neither NO SQL nor READS SQL DATA in its declaration and binary logging is enabled; if non-transactional tables were updated, the binary log will miss their changes
- Error: 1418 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_ROUTINE)  
 Message: This function has none of DETERMINISTIC, NO SQL, or READS SQL DATA in its declaration and binary logging is enabled (you \*might\* want to use the less safe log\_bin\_trust\_function\_creators variable)
- Error: 1419 SQLSTATE: HY000 (ER\_BINLOG\_CREATE\_ROUTINE\_NEED\_SUPER)  
 Message: You do not have the SUPER privilege and binary logging is enabled (you \*might\* want to use the less safe log\_bin\_trust\_function\_creators variable)
- Error: 1420 SQLSTATE: HY000 (ER\_EXEC\_STMT\_WITH\_OPEN\_CURSOR)  
 Message: You can't execute a prepared statement which has an open cursor associated with it. Reset the statement to re-execute it.
- Error: 1421 SQLSTATE: HY000 (ER\_STMT\_HAS\_NO\_OPEN\_CURSOR)  
 Message: The statement (%lu) has no open cursor.
- Error: 1422 SQLSTATE: HY000 (ER\_COMMIT\_NOT\_ALLOWED\_IN\_SF\_OR\_TRG)  
 Message: Explicit or implicit commit is not allowed in stored function or trigger.
- Error: 1423 SQLSTATE: HY000 (ER\_NO\_DEFAULT\_FOR\_VIEW\_FIELD)  
 Message: Field of view '%s.%s' underlying table doesn't have a default value
- Error: 1424 SQLSTATE: HY000 (ER\_SP\_NO\_RECURSION)  
 Message: Recursive stored functions and triggers are not allowed.
- Error: 1425 SQLSTATE: 42000 (ER\_TOO\_BIG\_SCALE)  
 Message: Too big scale %d specified for column '%s'. Maximum is %lu.
- Error: 1426 SQLSTATE: 42000 (ER\_TOO\_BIG\_PRECISION)  
 Message: Too-big precision %d specified for '%s'. Maximum is %lu.
- Error: 1427 SQLSTATE: 42000 (ER\_M\_BIGGER\_THAN\_D)  
 Message: For float(M,D), double(M,D) or decimal(M,D), M must be >= D (column '%s').
- Error: 1428 SQLSTATE: HY000 (ER\_WRONG\_LOCK\_OF\_SYSTEM\_TABLE)  
 Message: You can't combine write-locking of system tables with other tables or lock types
- Error: 1429 SQLSTATE: HY000 (ER\_CONNECT\_TO\_FOREIGN\_DATA\_SOURCE)  
 Message: Unable to connect to foreign data source: %s

- Error: 1430 SQLSTATE: HY000 (ER\_QUERY\_ON\_FOREIGN\_DATA\_SOURCE)  
Message: There was a problem processing the query on the foreign data source. Data source error: %s
- Error: 1431 SQLSTATE: HY000 (ER\_FOREIGN\_DATA\_SOURCE\_DOESNT\_EXIST)  
Message: The foreign data source you are trying to reference does not exist. Data source error: %s
- Error: 1432 SQLSTATE: HY000 (ER\_FOREIGN\_DATA\_STRING\_INVALID\_CANT\_CREATE)  
Message: Can't create federated table. The data source connection string '%s' is not in the correct format
- Error: 1433 SQLSTATE: HY000 (ER\_FOREIGN\_DATA\_STRING\_INVALID)  
Message: The data source connection string '%s' is not in the correct format
- Error: 1434 SQLSTATE: HY000 (ER\_CANT\_CREATE\_FEDERATED\_TABLE)  
Message: Can't create federated table. Foreign data src error: %s
- Error: 1435 SQLSTATE: HY000 (ER\_TRG\_IN\_WRONG\_SCHEMA)  
Message: Trigger in wrong schema
- Error: 1436 SQLSTATE: HY000 (ER\_STACK\_OVERRUN\_NEED\_MORE)  
Message: Thread stack overrun: %ld bytes used of a %ld byte stack, and %ld bytes needed. Use 'mysqld --thread\_stack=#' to specify a bigger stack.
- Error: 1437 SQLSTATE: 42000 (ER\_TOO\_LONG\_BODY)  
Message: Routine body for '%s' is too long
- Error: 1438 SQLSTATE: HY000 (ER\_WARN\_CANT\_DROP\_DEFAULT\_KEYCACHE)  
Message: Cannot drop default keycache
- Error: 1439 SQLSTATE: 42000 (ER\_TOO\_BIG\_DISPLAYWIDTH)  
Message: Display width out of range for column '%s' (max = %lu)
- Error: 1440 SQLSTATE: XAE08 (ER\_XAER\_DUPID)  
Message: XAER\_DUPID: The XID already exists
- Error: 1441 SQLSTATE: 22008 (ER\_DATETIME\_FUNCTION\_OVERFLOW)  
Message: Datetime function: %s field overflow
- Error: 1442 SQLSTATE: HY000 (ER\_CANT\_UPDATE\_USED\_TABLE\_IN\_SF\_OR\_TRG)  
Message: Can't update table '%s' in stored function/trigger because it is already used by statement which invoked this stored function/trigger.
- Error: 1443 SQLSTATE: HY000 (ER\_VIEW\_PREVENT\_UPDATE)  
Message: The definition of table '%s' prevents operation %s on table '%s'.
- Error: 1444 SQLSTATE: HY000 (ER\_PS\_NO\_RECURSION)  
Message: The prepared statement contains a stored routine call that refers to that same statement. It's not allowed to execute a prepared statement in such a recursive manner

- Error: 1445 SQLSTATE: HY000 (ER\_SP\_CANT\_SET\_AUTOCOMMIT)  
Message: Not allowed to set autocommit from a stored function or trigger
- Error: 1446 SQLSTATE: HY000 (ER\_MALFORMED\_DEFINER)  
Message: Definer is not fully qualified
- Error: 1447 SQLSTATE: HY000 (ER\_VIEW\_FRM\_NO\_USER)  
Message: View '%s'.'%s' has no definer information (old table format). Current user is used as definer. Please recreate the view!
- Error: 1448 SQLSTATE: HY000 (ER\_VIEW\_OTHER\_USER)  
Message: You need the SUPER privilege for creation view with '%s'@'%s' definer
- Error: 1449 SQLSTATE: HY000 (ER\_NO\_SUCH\_USER)  
Message: The user specified as a definer ('%s'@'%s') does not exist
- Error: 1450 SQLSTATE: HY000 (ER\_FORBID\_SCHEMA\_CHANGE)  
Message: Changing schema from '%s' to '%s' is not allowed.
- Error: 1451 SQLSTATE: 23000 (ER\_ROW\_IS\_REFERENCED\_2)  
Message: Cannot delete or update a parent row: a foreign key constraint fails (%s)  
  
InnoDB reports this error when you try to delete a parent row that has children, and a [foreign key constraint](#) fails. Delete the children first.
- Error: 1452 SQLSTATE: 23000 (ER\_NO\_REFERENCED\_ROW\_2)  
Message: Cannot add or update a child row: a foreign key constraint fails (%s)  
  
InnoDB reports this error when you try to add a row but there is no parent row, and a [foreign key constraint](#) fails. Add the parent row first.
- Error: 1453 SQLSTATE: 42000 (ER\_SP\_BAD\_VAR\_SHADOW)  
Message: Variable '%s' must be quoted with `...`, or renamed
- Error: 1454 SQLSTATE: HY000 (ER\_TRG\_NO\_DEFINER)  
Message: No definer attribute for trigger '%s'.'%s'. The trigger will be activated under the authorization of the invoker, which may have insufficient privileges. Please recreate the trigger.
- Error: 1455 SQLSTATE: HY000 (ER\_OLD\_FILE\_FORMAT)  
Message: '%s' has an old format, you should re-create the '%s' object(s)
- Error: 1456 SQLSTATE: HY000 (ER\_SP\_RECURSION\_LIMIT)  
Message: Recursive limit %d (as set by the max\_sp\_recursion\_depth variable) was exceeded for routine %s
- Error: 1457 SQLSTATE: HY000 (ER\_SP\_PROC\_TABLE\_CORRUPT)  
Message: Failed to load routine %s. The table mysql.proc is missing, corrupt, or contains bad data (internal code %d)
- Error: 1458 SQLSTATE: 42000 (ER\_SP\_WRONG\_NAME)

Message: Incorrect routine name '%s'

- Error: 1459 SQLSTATE: HY000 (ER\_TABLE\_NEEDS\_UPGRADE)

Message: Table upgrade required. Please do "REPAIR TABLE '%s'" or dump/reload to fix it!

- Error: 1460 SQLSTATE: 42000 (ER\_SP\_NO\_AGGREGATE)

Message: AGGREGATE is not supported for stored functions

- Error: 1461 SQLSTATE: 42000 (ER\_MAX\_PREPARED\_STMT\_COUNT\_REACHED)

Message: Can't create more than max\_prepared\_stmt\_count statements (current value: %lu)

- Error: 1462 SQLSTATE: HY000 (ER\_VIEW\_RECURSIVE)

Message: '%s'. '%s' contains view recursion

- Error: 1463 SQLSTATE: 42000 (ER\_NON\_GROUPING\_FIELD\_USED)

Message: Non-grouping field '%s' is used in %s clause

- Error: 1464 SQLSTATE: HY000 (ER\_TABLE\_CANT\_HANDLE\_SPKEYS)

Message: The used table type doesn't support SPATIAL indexes

- Error: 1465 SQLSTATE: HY000 (ER\_NO\_TRIGGERS\_ON\_SYSTEM\_SCHEMA)

Message: Triggers can not be created on system tables

- Error: 1466 SQLSTATE: HY000 (ER\_REMOVED\_SPACES)

Message: Leading spaces are removed from name '%s'

- Error: 1467 SQLSTATE: HY000 (ER\_AUTOINC\_READ\_FAILED)

Message: Failed to read auto-increment value from storage engine

- Error: 1468 SQLSTATE: HY000 (ER\_USERNAME)

Message: user name

- Error: 1469 SQLSTATE: HY000 (ER\_HOSTNAME)

Message: host name

- Error: 1470 SQLSTATE: HY000 (ER\_WRONG\_STRING\_LENGTH)

Message: String '%s' is too long for %s (should be no longer than %d)

- Error: 1471 SQLSTATE: HY000 (ER\_NON\_INSERTABLE\_TABLE)

Message: The target table %s of the %s is not insertable-into

- Error: 1472 SQLSTATE: HY000 (ER\_ADMIN\_WRONG\_MRG\_TABLE)

Message: Table '%s' is differently defined or of non-MyISAM type or doesn't exist

- Error: 1473 SQLSTATE: HY000 (ER\_TOO\_HIGH\_LEVEL\_OF\_NESTING\_FOR\_SELECT)

Message: Too high level of nesting for select

- Error: 1474 SQLSTATE: HY000 (ER\_NAME\_BECOMES\_EMPTY)

Message: Name '%s' has become "

- Error: 1475 SQLSTATE: HY000 (ER\_AMBIGUOUS\_FIELD\_TERM)  
 Message: First character of the FIELDS TERMINATED string is ambiguous; please use non-optional and non-empty FIELDS ENCLOSED BY
- Error: 1476 SQLSTATE: HY000 (ER\_FOREIGN\_SERVER\_EXISTS)  
 Message: The foreign server, %s, you are trying to create already exists.
- Error: 1477 SQLSTATE: HY000 (ER\_FOREIGN\_SERVER\_DOESNT\_EXIST)  
 Message: The foreign server name you are trying to reference does not exist. Data source error: %s
- Error: 1478 SQLSTATE: HY000 (ER\_ILLEGAL\_HA\_CREATE\_OPTION)  
 Message: Table storage engine '%s' does not support the create option '%s'
- Error: 1479 SQLSTATE: HY000 (ER\_PARTITION\_REQUIRES\_VALUES\_ERROR)  
 Message: Syntax error: %s PARTITIONING requires definition of VALUES %s for each partition
- Error: 1480 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_VALUES\_ERROR)  
 Message: Only %s PARTITIONING can use VALUES %s in partition definition
- Error: 1481 SQLSTATE: HY000 (ER\_PARTITION\_MAXVALUE\_ERROR)  
 Message: MAXVALUE can only be used in last partition definition
- Error: 1482 SQLSTATE: HY000 (ER\_PARTITION\_SUBPARTITION\_ERROR)  
 Message: Subpartitions can only be hash partitions and by key
- Error: 1483 SQLSTATE: HY000 (ER\_PARTITION\_SUBPART\_MIX\_ERROR)  
 Message: Must define subpartitions on all partitions if on one partition
- Error: 1484 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_NO\_PART\_ERROR)  
 Message: Wrong number of partitions defined, mismatch with previous setting
- Error: 1485 SQLSTATE: HY000 (ER\_PARTITION\_WRONG\_NO\_SUBPART\_ERROR)  
 Message: Wrong number of subpartitions defined, mismatch with previous setting
- Error: 1486 SQLSTATE: HY000 (ER\_WRONG\_EXPR\_IN\_PARTITION\_FUNC\_ERROR)  
 Message: Constant, random or timezone-dependent expressions in (sub)partitioning function are not allowed
- Error: 1487 SQLSTATE: HY000 (ER\_NO\_CONST\_EXPR\_IN\_RANGE\_OR\_LIST\_ERROR)  
 Message: Expression in RANGE/LIST VALUES must be constant
- Error: 1488 SQLSTATE: HY000 (ER\_FIELD\_NOT\_FOUND\_PART\_ERROR)  
 Message: Field in list of fields for partition function not found in table
- Error: 1489 SQLSTATE: HY000 (ER\_LIST\_OF\_FIELDS\_ONLY\_IN\_HASH\_ERROR)  
 Message: List of fields is only allowed in KEY partitions
- Error: 1490 SQLSTATE: HY000 (ER\_INCONSISTENT\_PARTITION\_INFO\_ERROR)  
 Message: The partition info in the frm file is not consistent with what can be written into the frm file

- Error: 1491 SQLSTATE: HY000 (ER\_PARTITION\_FUNC\_NOT\_ALLOWED\_ERROR)  
Message: The %s function returns the wrong type
- Error: 1492 SQLSTATE: HY000 (ER\_PARTITIONS\_MUST\_BE\_DEFINED\_ERROR)  
Message: For %s partitions each partition must be defined
- Error: 1493 SQLSTATE: HY000 (ER\_RANGE\_NOT\_INCREASING\_ERROR)  
Message: VALUES LESS THAN value must be strictly increasing for each partition
- Error: 1494 SQLSTATE: HY000 (ER\_INCONSISTENT\_TYPE\_OF\_FUNCTIONS\_ERROR)  
Message: VALUES value must be of same type as partition function
- Error: 1495 SQLSTATE: HY000 (ER\_MULTIPLE\_DEF\_CONST\_IN\_LIST\_PART\_ERROR)  
Message: Multiple definition of same constant in list partitioning
- Error: 1496 SQLSTATE: HY000 (ER\_PARTITION\_ENTRY\_ERROR)  
Message: Partitioning can not be used stand-alone in query
- Error: 1497 SQLSTATE: HY000 (ER\_MIX\_HANDLER\_ERROR)  
Message: The mix of handlers in the partitions is not allowed in this version of MySQL
- Error: 1498 SQLSTATE: HY000 (ER\_PARTITION\_NOT\_DEFINED\_ERROR)  
Message: For the partitioned engine it is necessary to define all %s
- Error: 1499 SQLSTATE: HY000 (ER\_TOO\_MANY\_PARTITIONS\_ERROR)  
Message: Too many partitions (including subpartitions) were defined
- Error: 1500 SQLSTATE: HY000 (ER\_SUBPARTITION\_ERROR)  
Message: It is only possible to mix RANGE/LIST partitioning with HASH/KEY partitioning for subpartitioning
- Error: 1501 SQLSTATE: HY000 (ER\_CANT\_CREATE\_HANDLER\_FILE)  
Message: Failed to create specific handler file
- Error: 1502 SQLSTATE: HY000 (ER\_BLOB\_FIELD\_IN\_PART\_FUNC\_ERROR)  
Message: A BLOB field is not allowed in partition function
- Error: 1503 SQLSTATE: HY000 (ER\_UNIQUE\_KEY\_NEED\_ALL\_FIELDS\_IN\_PF)  
Message: A %s must include all columns in the table's partitioning function
- Error: 1504 SQLSTATE: HY000 (ER\_NO\_PARTS\_ERROR)  
Message: Number of %s = 0 is not an allowed value
- Error: 1505 SQLSTATE: HY000 (ER\_PARTITION\_MGMT\_ON\_NONPARTITIONED)  
Message: Partition management on a not partitioned table is not possible
- Error: 1506 SQLSTATE: HY000 (ER\_FOREIGN\_KEY\_ON\_PARTITIONED)  
Message: Foreign keys are not yet supported in conjunction with partitioning
- Error: 1507 SQLSTATE: HY000 (ER\_DROP\_PARTITION\_NON\_EXISTENT)

Message: Error in list of partitions to %s

- Error: 1508 SQLSTATE: HY000 (ER\_DROP\_LAST\_PARTITION)

Message: Cannot remove all partitions, use DROP TABLE instead

- Error: 1509 SQLSTATE: HY000 (ER\_COALESCE\_ONLY\_ON\_HASH\_PARTITION)

Message: COALESCE PARTITION can only be used on HASH/KEY partitions

- Error: 1510 SQLSTATE: HY000 (ER\_REORG\_HASH\_ONLY\_ON\_SAME\_NO)

Message: REORGANIZE PARTITION can only be used to reorganize partitions not to change their numbers

- Error: 1511 SQLSTATE: HY000 (ER\_REORG\_NO\_PARAM\_ERROR)

Message: REORGANIZE PARTITION without parameters can only be used on auto-partitioned tables using HASH PARTITIONS

- Error: 1512 SQLSTATE: HY000 (ER\_ONLY\_ON\_RANGE\_LIST\_PARTITION)

Message: %s PARTITION can only be used on RANGE/LIST partitions

- Error: 1513 SQLSTATE: HY000 (ER\_ADD\_PARTITION\_SUBPART\_ERROR)

Message: Trying to Add partition(s) with wrong number of subpartitions

- Error: 1514 SQLSTATE: HY000 (ER\_ADD\_PARTITION\_NO\_NEW\_PARTITION)

Message: At least one partition must be added

- Error: 1515 SQLSTATE: HY000 (ER\_COALESCE\_PARTITION\_NO\_PARTITION)

Message: At least one partition must be coalesced

- Error: 1516 SQLSTATE: HY000 (ER\_REORG\_PARTITION\_NOT\_EXIST)

Message: More partitions to reorganize than there are partitions

- Error: 1517 SQLSTATE: HY000 (ER\_SAME\_NAME\_PARTITION)

Message: Duplicate partition name %s

- Error: 1518 SQLSTATE: HY000 (ER\_NO\_BINLOG\_ERROR)

Message: It is not allowed to shut off binlog on this command

- Error: 1519 SQLSTATE: HY000 (ER\_CONSECUTIVE\_REORG\_PARTITIONS)

Message: When reorganizing a set of partitions they must be in consecutive order

- Error: 1520 SQLSTATE: HY000 (ER\_REORG\_OUTSIDE\_RANGE)

Message: Reorganize of range partitions cannot change total ranges except for last partition where it can extend the range

- Error: 1521 SQLSTATE: HY000 (ER\_PARTITION\_FUNCTION\_FAILURE)

Message: Partition function not supported in this version for this handler

- Error: 1522 SQLSTATE: HY000 (ER\_PART\_STATE\_ERROR)

Message: Partition state cannot be defined from CREATE/ALTER TABLE

- Error: 1523 SQLSTATE: HY000 (ER\_LIMITED\_PART\_RANGE)  
Message: The %s handler only supports 32 bit integers in VALUES
- Error: 1524 SQLSTATE: HY000 (ER\_PLUGIN\_IS\_NOT\_LOADED)  
Message: Plugin '%s' is not loaded
- Error: 1525 SQLSTATE: HY000 (ER\_WRONG\_VALUE)  
Message: Incorrect %s value: '%s'
- Error: 1526 SQLSTATE: HY000 (ER\_NO\_PARTITION\_FOR\_GIVEN\_VALUE)  
Message: Table has no partition for value %s
- Error: 1527 SQLSTATE: HY000 (ER\_FILEGROUP\_OPTION\_ONLY\_ONCE)  
Message: It is not allowed to specify %s more than once
- Error: 1528 SQLSTATE: HY000 (ER\_CREATE\_FILEGROUP\_FAILED)  
Message: Failed to create %s
- Error: 1529 SQLSTATE: HY000 (ER\_DROP\_FILEGROUP\_FAILED)  
Message: Failed to drop %s
- Error: 1530 SQLSTATE: HY000 (ER\_TABLESPACE\_AUTO\_EXTEND\_ERROR)  
Message: The handler doesn't support autoextend of tablespaces
- Error: 1531 SQLSTATE: HY000 (ER\_WRONG\_SIZE\_NUMBER)  
Message: A size parameter was incorrectly specified, either number or on the form 10M
- Error: 1532 SQLSTATE: HY000 (ER\_SIZE\_OVERFLOW\_ERROR)  
Message: The size number was correct but we don't allow the digit part to be more than 2 billion
- Error: 1533 SQLSTATE: HY000 (ER\_ALTER\_FILEGROUP\_FAILED)  
Message: Failed to alter: %s
- Error: 1534 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_LOGGING\_FAILED)  
Message: Writing one row to the row-based binary log failed
- Error: 1535 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_WRONG\_TABLE\_DEF)  
Message: Table definition on master and slave does not match: %s
- Error: 1536 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_RBR\_TO\_SBR)  
Message: Slave running with --log-slave-updates must use row-based binary logging to be able to replicate row-based binary log events
- Error: 1537 SQLSTATE: HY000 (ER\_EVENT\_ALREADY\_EXISTS)  
Message: Event '%s' already exists
- Error: 1538 SQLSTATE: HY000 (ER\_EVENT\_STORE\_FAILED)  
Message: Failed to store event %s. Error code %d from storage engine.
- Error: 1539 SQLSTATE: HY000 (ER\_EVENT\_DOES\_NOT\_EXIST)

Message: Unknown event '%s'

- Error: 1540 SQLSTATE: HY000 (ER\_EVENT\_CANT\_ALTER)

Message: Failed to alter event '%s'

- Error: 1541 SQLSTATE: HY000 (ER\_EVENT\_DROP\_FAILED)

Message: Failed to drop %s

- Error: 1542 SQLSTATE: HY000 (ER\_EVENT\_INTERVAL\_NOT\_POSITIVE\_OR\_TOO\_BIG)

Message: INTERVAL is either not positive or too big

- Error: 1543 SQLSTATE: HY000 (ER\_EVENT\_ENDS\_BEFORE\_STARTS)

Message: ENDS is either invalid or before STARTS

- Error: 1544 SQLSTATE: HY000 (ER\_EVENT\_EXEC\_TIME\_IN\_THE\_PAST)

Message: Event execution time is in the past. Event has been disabled

- Error: 1545 SQLSTATE: HY000 (ER\_EVENT\_OPEN\_TABLE\_FAILED)

Message: Failed to open mysql.event

- Error: 1546 SQLSTATE: HY000 (ER\_EVENT\_NEITHER\_M\_EXPR\_NOR\_M\_AT)

Message: No datetime expression provided

- Error: 1547 SQLSTATE: HY000 (ER\_OBSOLETE\_COL\_COUNT\_DOESNT\_MATCH\_CORRUPTED)

Message: Column count of mysql.%s is wrong. Expected %d, found %d. The table is probably corrupted

- Error: 1548 SQLSTATE: HY000 (ER\_OBSOLETE\_CANNOT\_LOAD\_FROM\_TABLE)

Message: Cannot load from mysql.%s. The table is probably corrupted

- Error: 1549 SQLSTATE: HY000 (ER\_EVENT\_CANNOT\_DELETE)

Message: Failed to delete the event from mysql.event

- Error: 1550 SQLSTATE: HY000 (ER\_EVENT\_COMPILE\_ERROR)

Message: Error during compilation of event's body

- Error: 1551 SQLSTATE: HY000 (ER\_EVENT\_SAME\_NAME)

Message: Same old and new event name

- Error: 1552 SQLSTATE: HY000 (ER\_EVENT\_DATA\_TOO\_LONG)

Message: Data for column '%s' too long

- Error: 1553 SQLSTATE: HY000 (ER\_DROP\_INDEX\_FK)

Message: Cannot drop index '%s': needed in a foreign key constraint

[InnoDB](#) reports this error when you attempt to drop the last index that can enforce a particular referential constraint.

For optimal performance with DML statements, [InnoDB](#) requires an index to exist on [foreign key](#) columns, so that [UPDATE](#) and [DELETE](#) operations on a [parent table](#) can easily check whether

corresponding rows exist in the [child table](#). MySQL creates or drops such indexes automatically when needed, as a side-effect of [CREATE TABLE](#), [CREATE INDEX](#), and [ALTER TABLE](#) statements.

When you drop an index, [InnoDB](#) checks if the index is used for checking a foreign key constraint. It is still OK to drop the index if there is another index that can be used to enforce the same constraint. [InnoDB](#) prevents you from dropping the last index that can enforce a particular referential constraint.

- Error: [1554](#) SQLSTATE: [HY000](#) ([ER\\_WARN\\_DEPRECATED\\_SYNTAX\\_WITH\\_VER](#))  
 Message: The syntax '%s' is deprecated and will be removed in MySQL %s. Please use %s instead
- Error: [1555](#) SQLSTATE: [HY000](#) ([ER\\_CANT\\_WRITE\\_LOCK\\_LOG\\_TABLE](#))  
 Message: You can't write-lock a log table. Only read access is possible
- Error: [1556](#) SQLSTATE: [HY000](#) ([ER\\_CANT\\_LOCK\\_LOG\\_TABLE](#))  
 Message: You can't use locks with log tables.
- Error: [1557](#) SQLSTATE: [23000](#) ([ER\\_FOREIGN\\_DUPLICATE\\_KEY\\_OLD\\_UNUSED](#))  
 Message: Upholding foreign key constraints for table '%s', entry '%s', key %d would lead to a duplicate entry
- Error: [1558](#) SQLSTATE: [HY000](#) ([ER\\_COL\\_COUNT\\_DOESNT\\_MATCH\\_PLEASE\\_UPDATE](#))  
 Message: Column count of mysql.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql\_upgrade to fix this error.

Message: Duplicate partition field name '%s'
- Error: 1653 SQLSTATE: HY000 (ER\_PARTITION\_COLUMN\_LIST\_ERROR)  
Message: Inconsistency in usage of column lists for partitioning
- Error: 1654 SQLSTATE: HY000 (ER\_WRONG\_TYPE\_COLUMN\_VALUE\_ERROR)  
Message: Partition column values of incorrect type
- Error: 1655 SQLSTATE: HY000 (ER\_TOO\_MANY\_PARTITION\_FUNC\_FIELDS\_ERROR)  
Message: Too many fields in '%s'
- Error: 1656 SQLSTATE: HY000 (ER\_MAXVALUE\_IN\_VALUES\_IN)  
Message: Cannot use MAXVALUE as value in VALUES IN
- Error: 1657 SQLSTATE: HY000 (ER\_TOO\_MANY\_VALUES\_ERROR)  
Message: Cannot have more than one value for this type of %s partitioning

- Error: 1658 SQLSTATE: HY000 (ER\_ROW\_SINGLE\_PARTITION\_FIELD\_ERROR)  
Message: Row expressions in VALUES IN only allowed for multi-field column partitioning
- Error: 1659 SQLSTATE: HY000 (ER\_FIELD\_TYPE\_NOT\_ALLOWED\_AS\_PARTITION\_FIELD)  
Message: Field '%s' is of a not allowed type for this type of partitioning
- Error: 1660 SQLSTATE: HY000 (ER\_PARTITION\_FIELDS\_TOO\_LONG)  
Message: The total length of the partitioning fields is too large
- Error: 1661 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_ENGINE\_AND\_STMT\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since both row-incapable engines and statement-incapable engines are involved.
- Error: 1662 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_MODE\_AND\_STMT\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = ROW and at least one table uses a storage engine limited to statement-based logging.
- Error: 1663 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AND\_STMT\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since statement is unsafe, storage engine is limited to statement-based logging, and BINLOG\_FORMAT = MIXED. %s
- Error: 1664 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_INJECTION\_AND\_STMT\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and at least one table uses a storage engine limited to statement-based logging.
- Error: 1665 SQLSTATE: HY000 (ER\_BINLOG\_STMT\_MODE\_AND\_ROW\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = STATEMENT and at least one table uses a storage engine limited to row-based logging.%s
- Error: 1666 SQLSTATE: HY000 (ER\_BINLOG\_ROW\_INJECTION\_AND\_STMT\_MODE)  
Message: Cannot execute statement: impossible to write to binary log since statement is in row format and BINLOG\_FORMAT = STATEMENT.
- Error: 1667 SQLSTATE: HY000  
(ER\_BINLOG\_MULTIPLE\_ENGINES\_AND\_SELF\_LOGGING\_ENGINE)  
Message: Cannot execute statement: impossible to write to binary log since more than one engine is involved and at least one engine is self-logging.
- Error: 1668 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_LIMIT)  
Message: The statement is unsafe because it uses a LIMIT clause. This is unsafe because the set of rows included cannot be predicted.
- Error: 1669 SQLSTATE: HY000 (ER\_UNUSED4)  
Message: The statement is unsafe because it uses INSERT DELAYED. This is unsafe because the times when rows are inserted cannot be predicted.
- Error: 1670 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_TABLE)  
Message: The statement is unsafe because it uses the general log, slow query log, or performance\_schema table(s). This is unsafe because system tables may differ on slaves.
- Error: 1671 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AUTOINC\_COLUMNS)

Message: Statement is unsafe because it invokes a trigger or a stored function that inserts into an AUTO\_INCREMENT column. Inserted values cannot be logged correctly.

- Error: 1672 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_UDF)

Message: Statement is unsafe because it uses a UDF which may not return the same value on the slave.

- Error: 1673 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_VARIABLE)

Message: Statement is unsafe because it uses a system variable that may have a different value on the slave.

- Error: 1674 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_SYSTEM\_FUNCTION)

Message: Statement is unsafe because it uses a system function that may return a different value on the slave.

- Error: 1675 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_NONTRANS\_AFTER\_TRANS)

Message: Statement is unsafe because it accesses a non-transactional table after accessing a transactional table within the same transaction.

- Error: 1676 SQLSTATE: HY000 (ER\_MESSAGE\_AND\_STATEMENT)

Message: %s Statement: %s

- Error: 1677 SQLSTATE: HY000 (ER\_SLAVE\_CONVERSION\_FAILED)

Message: Column %d of table '%s.%s' cannot be converted from type '%s' to type '%s'

- Error: 1678 SQLSTATE: HY000 (ER\_SLAVE\_CANT\_CREATE\_CONVERSION)

Message: Can't create conversion table for table '%s.%s'

- Error: 1679 SQLSTATE: HY000  
(ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_BINLOG\_FORMAT)

Message: Cannot modify @@session.binlog\_format inside a transaction

- Error: 1680 SQLSTATE: HY000 (ER\_PATH\_LENGTH)

Message: The path specified for %s is too long.

- Error: 1681 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SYNTAX\_NO\_REPLACEMENT)

Message: '%s' is deprecated and will be removed in a future release.

- Error: 1682 SQLSTATE: HY000 (ER\_WRONG\_NATIVE\_TABLE\_STRUCTURE)

Message: Native table '%s'.'%s' has the wrong structure

- Error: 1683 SQLSTATE: HY000 (ER\_WRONG\_PERFSCHEMA\_USAGE)

Message: Invalid performance\_schema usage.

- Error: 1684 SQLSTATE: HY000 (ER\_WARN\_I\_S\_SKIPPED\_TABLE)

Message: Table '%s'.'%s' was skipped since its definition is being modified by concurrent DDL statement

- Error: 1685 SQLSTATE: HY000  
(ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_BINLOG\_DIRECT)

- Message: Cannot modify @@session.binlog\_direct\_non\_transactional\_updates inside a transaction
- Error: 1686 SQLSTATE: HY000 (ER\_STORED\_FUNCTION\_PREVENTS\_SWITCH\_BINLOG\_DIRECT)  
Message: Cannot change the binlog direct flag inside a stored function or trigger
  - Error: 1687 SQLSTATE: 42000 (ER\_SPATIAL\_MUST\_HAVE\_GEOM\_COL)  
Message: A SPATIAL index may only contain a geometrical type column
  - Error: 1688 SQLSTATE: HY000 (ER\_TOO\_LONG\_INDEX\_COMMENT)  
Message: Comment for index '%s' is too long (max = %lu)
  - Error: 1689 SQLSTATE: HY000 (ER\_LOCK\_ABORTED)  
Message: Wait on a lock was aborted due to a pending exclusive lock
  - Error: 1690 SQLSTATE: 22003 (ER\_DATA\_OUT\_OF\_RANGE)  
Message: %s value is out of range in '%s'
  - Error: 1691 SQLSTATE: HY000 (ER\_WRONG\_SPVAR\_TYPE\_IN\_LIMIT)  
Message: A variable of a non-integer based type in LIMIT clause
  - Error: 1692 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_MULTIPLE\_ENGINES\_AND\_SELF\_LOGGING\_ENGINE)  
Message: Mixing self-logging and non-self-logging engines in a statement is unsafe.
  - Error: 1693 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_MIXED\_STATEMENT)  
Message: Statement accesses nontransactional table as well as transactional or temporary table, and writes to any of them.
  - Error: 1694 SQLSTATE: HY000 (ER\_INSIDE\_TRANSACTION\_PREVENTS\_SWITCH\_SQL\_LOG\_BIN)  
Message: Cannot modify @@session.sql\_log\_bin inside a transaction
  - Error: 1695 SQLSTATE: HY000 (ER\_STORED\_FUNCTION\_PREVENTS\_SWITCH\_SQL\_LOG\_BIN)  
Message: Cannot change the sql\_log\_bin inside a stored function or trigger
  - Error: 1696 SQLSTATE: HY000 (ER\_FAILED\_READ\_FROM\_PAR\_FILE)  
Message: Failed to read from the .par file
  - Error: 1697 SQLSTATE: HY000 (ER\_VALUES\_IS\_NOT\_INT\_TYPE\_ERROR)  
Message: VALUES value for partition '%s' must have type INT
  - Error: 1698 SQLSTATE: 28000 (ER\_ACCESS\_DENIED\_NO\_PASSWORD\_ERROR)  
Message: Access denied for user '%s'@'%s'
  - Error: 1699 SQLSTATE: HY000 (ER\_SET\_PASSWORD\_AUTH\_PLUGIN)  
Message: SET PASSWORD has no significance for users authenticating via plugins
  - Error: 1700 SQLSTATE: HY000 (ER\_GRANT\_PLUGIN\_USER\_EXISTS)  
Message: GRANT with IDENTIFIED WITH is illegal because the user %-.\*s already exists

- Error: 1701 SQLSTATE: 42000 (ER\_TRUNCATE\_ILLEGAL\_FK)  
Message: Cannot truncate a table referenced in a foreign key constraint (%s)
- Error: 1702 SQLSTATE: HY000 (ER\_PLUGIN\_IS\_PERMANENT)  
Message: Plugin '%s' is force\_plus\_permanent and can not be unloaded
- Error: 1703 SQLSTATE: HY000 (ER\_SLAVE\_HEARTBEAT\_VALUE\_OUT\_OF\_RANGE\_MIN)  
Message: The requested value for the heartbeat period is less than 1 millisecond. The value is reset to 0, meaning that heartbeating will effectively be disabled.
- Error: 1704 SQLSTATE: HY000 (ER\_SLAVE\_HEARTBEAT\_VALUE\_OUT\_OF\_RANGE\_MAX)  
Message: The requested value for the heartbeat period exceeds the value of `slave\_net\_timeout` seconds. A sensible value for the period should be less than the timeout.
- Error: 1705 SQLSTATE: HY000 (ER\_STMT\_CACHE\_FULL)  
Message: Multi-row statements required more than 'max\_binlog\_stmt\_cache\_size' bytes of storage; increase this mysqld variable and try again
- Error: 1706 SQLSTATE: HY000 (ER\_MULTI\_UPDATE\_KEY\_CONFLICT)  
Message: Primary key/partition key update is not allowed since the table is updated both as '%s' and '%s'.
- Error: 1707 SQLSTATE: HY000 (ER\_TABLE\_NEEDS\_REBUILD)  
Message: Table rebuild required. Please do "ALTER TABLE `%s` FORCE" or dump/reload to fix it!
- Error: 1708 SQLSTATE: HY000 (WARN\_OPTION\_BELOW\_LIMIT)  
Message: The value of '%s' should be no less than the value of '%s'
- Error: 1709 SQLSTATE: HY000 (ER\_INDEX\_COLUMN\_TOO\_LONG)  
Message: Index column size too large. The maximum column size is %lu bytes.
- Error: 1710 SQLSTATE: HY000 (ER\_ERROR\_IN\_TRIGGER\_BODY)  
Message: Trigger '%s' has an error in its body: '%s'
- Error: 1711 SQLSTATE: HY000 (ER\_ERROR\_IN\_UNKNOWN\_TRIGGER\_BODY)  
Message: Unknown trigger has an error in its body: '%s'
- Error: 1712 SQLSTATE: HY000 (ER\_INDEX\_CORRUPT)  
Message: Index %s is corrupted
- Error: 1713 SQLSTATE: HY000 (ER\_UNDO\_RECORD\_TOO\_BIG)  
Message: Undo log record is too big.
- Error: 1714 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_INSERT\_IGNORE\_SELECT)  
Message: INSERT IGNORE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.
- Error: 1715 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_INSERT\_SELECT\_UPDATE)

Message: INSERT... SELECT... ON DUPLICATE KEY UPDATE is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are updated. This order cannot be predicted and may differ on master and the slave.

- Error: 1716 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_REPLACE\_SELECT)

Message: REPLACE... SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1717 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_IGNORE\_SELECT)

Message: CREATE... IGNORE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1718 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_REPLACE\_SELECT)

Message: CREATE... REPLACE SELECT is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are replaced. This order cannot be predicted and may differ on master and the slave.

- Error: 1719 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_UPDATE\_IGNORE)

Message: UPDATE IGNORE is unsafe because the order in which rows are updated determines which (if any) rows are ignored. This order cannot be predicted and may differ on master and the slave.

- Error: 1720 SQLSTATE: HY000 (ER\_PLUGIN\_NO\_UNINSTALL)

Message: Plugin '%s' is marked as not dynamically uninstallable. You have to stop the server to uninstall it.

- Error: 1721 SQLSTATE: HY000 (ER\_PLUGIN\_NO\_INSTALL)

Message: Plugin '%s' is marked as not dynamically installable. You have to stop the server to install it.

- Error: 1722 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_WRITE\_AUTOINC\_SELECT)

Message: Statements writing to a table with an auto-increment column after selecting from another table are unsafe because the order in which rows are retrieved determines what (if any) rows will be written. This order cannot be predicted and may differ on master and the slave.

- Error: 1723 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_CREATE\_SELECT\_AUTOINC)

Message: CREATE TABLE... SELECT... on a table with an auto-increment column is unsafe because the order in which rows are retrieved by the SELECT determines which (if any) rows are inserted. This order cannot be predicted and may differ on master and the slave.

- Error: 1724 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_INSERT\_TWO\_KEYS)

Message: INSERT... ON DUPLICATE KEY UPDATE on a table with more than one UNIQUE KEY is unsafe

- Error: 1725 SQLSTATE: HY000 (ER\_TABLE\_IN\_FK\_CHECK)

Message: Table is being used in foreign key check.

- Error: 1726 SQLSTATE: HY000 (ER\_UNSUPPORTED\_ENGINE)

Message: Storage engine '%s' does not support system tables. [%s.%s]

- Error: 1727 SQLSTATE: HY000 (ER\_BINLOG\_UNSAFE\_AUTOINC\_NOT\_FIRST)

Message: INSERT into autoincrement field which is not the first part in the composed primary key is unsafe.

- Error: 1728 SQLSTATE: HY000 (ER\_CANNOT\_LOAD\_FROM\_TABLE\_V2)

Message: Cannot load from %s.%s. The table is probably corrupted

- Error: 1729 SQLSTATE: HY000 (ER\_MASTER\_DELAY\_VALUE\_OUT\_OF\_RANGE)

Message: The requested value %s for the master delay exceeds the maximum %u

- Error: 1730 SQLSTATE: HY000  
(ER\_ONLY\_FD\_AND\_RBR\_EVENTS\_ALLOWED\_IN\_BINLOG\_STATEMENT)

Message: Non matching attribute '%s' between partition and table

- Error: 1732 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_PART\_TABLE)

Message: Table to exchange with partition is partitioned: '%s'

- Error: 1733 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_TEMP\_TABLE)

Message: Table to exchange with partition is temporary: '%s'

- Error: 1734 SQLSTATE: HY000 (ER\_PARTITION\_INSTEAD\_OF\_SUBPARTITION)

Message: Subpartitioned table, use subpartition instead of partition

- Error: 1735 SQLSTATE: HY000 (ER\_UNKNOWN\_PARTITION)

Message: Unknown partition '%s' in table '%s'

- Error: 1736 SQLSTATE: HY000 (ER\_TABLES\_DIFFERENT\_METADATA)

Message: Tables have different definitions

- Error: 1737 SQLSTATE: HY000 (ER\_ROW\_DOES\_NOT\_MATCH\_PARTITION)

Message: Found a row that does not match the partition

- Error: 1738 SQLSTATE: HY000 (ER\_BINLOG\_CACHE\_SIZE\_GREATER\_THAN\_MAX)

Message: Option binlog\_cache\_size (%lu) is greater than max\_binlog\_cache\_size (%lu); setting binlog\_cache\_size equal to max\_binlog\_cache\_size.

- Error: 1739 SQLSTATE: HY000 (ER\_WARN\_INDEX\_NOT\_APPLICABLE)

Message: Cannot use %s access on index '%s' due to type or collation conversion on field '%s'

- Error: 1740 SQLSTATE: HY000 (ER\_PARTITION\_EXCHANGE\_FOREIGN\_KEY)

Message: Table to exchange with partition has foreign key references: '%s'

- Error: 1741 SQLSTATE: HY000 (ER\_NO\_SUCH\_KEY\_VALUE)

Message: Key value '%s' was not found in table '%s.%s'

- Error: 1742 SQLSTATE: HY000 (ER\_RPL\_INFO\_DATA\_TOO\_LONG)  
Message: Data for column '%s' too long
- Error: 1743 SQLSTATE: HY000 (ER\_NETWORK\_READ\_EVENT\_CHECKSUM\_FAILURE)  
Message: Replication event checksum verification failed while reading from network.
- Error: 1744 SQLSTATE: HY000 (ER\_BINLOG\_READ\_EVENT\_CHECKSUM\_FAILURE)  
Message: Replication event checksum verification failed while reading from a log file.
- Error: 1745 SQLSTATE: HY000 (ER\_BINLOG\_STMT\_CACHE\_SIZE\_GREATER\_THAN\_MAX)  
Message: Option binlog\_stmt\_cache\_size (%lu) is greater than max\_binlog\_stmt\_cache\_size (%lu); setting binlog\_stmt\_cache\_size equal to max\_binlog\_stmt\_cache\_size.
- Error: 1746 SQLSTATE: HY000 (ER\_CANT\_UPDATE\_TABLE\_IN\_CREATE\_TABLE\_SELECT)  
Message: Can't update table '%s' while '%s' is being created.
- Error: 1747 SQLSTATE: HY000 (ER\_PARTITION\_CLAUSE\_ON\_NONPARTITIONED)  
Message: PARTITION () clause on non partitioned table
- Error: 1748 SQLSTATE: HY000 (ER\_ROW\_DOES\_NOT\_MATCH\_GIVEN\_PARTITION\_SET)  
Message: Found a row not matching the given partition set
- Error: 1749 SQLSTATE: HY000 (ER\_NO\_SUCH\_PARTITION\_\_UNUSED)  
Message: partition '%s' doesn't exist
- Error: 1750 SQLSTATE: HY000 (ER\_CHANGE\_RPL\_INFO\_REPOSITORY\_FAILURE)  
Message: Failure while changing the type of replication repository: %s.
- Error: 1751 SQLSTATE: HY000  
(ER\_WARNING\_NOT\_COMPLETE\_ROLLBACK\_WITH\_CREATED\_TEMP\_TABLE)  
Message: The creation of some temporary tables could not be rolled back.
- Error: 1752 SQLSTATE: HY000  
(ER\_WARNING\_NOT\_COMPLETE\_ROLLBACK\_WITH\_DROPPED\_TEMP\_TABLE)  
Message: Some temporary tables were dropped, but these operations could not be rolled back.
- Error: 1753 SQLSTATE: HY000 (ER\_MTS\_FEATURE\_IS\_NOT\_SUPPORTED)  
Message: %s is not supported in multi-threaded slave mode. %s
- Error: 1754 SQLSTATE: HY000 (ER\_MTS\_UPDATED\_DBS\_GREATER\_MAX)  
Message: The number of modified databases exceeds the maximum %d; the database names will not be included in the replication event metadata.
- Error: 1755 SQLSTATE: HY000 (ER\_MTS\_CANT\_PARALLEL)  
Message: Cannot execute the current event group in the parallel mode. Encountered event %s, relay-log name %s, position %s which prevents execution of this event group in parallel mode. Reason: %s.
- Error: 1756 SQLSTATE: HY000 (ER\_MTS\_INCONSISTENT\_DATA)

Message: %s

- Error: 1757 SQLSTATE: HY000 (ER\_FULLTEXT\_NOT\_SUPPORTED\_WITH\_PARTITIONING)

Message: FULLTEXT index is not supported for partitioned tables.

- Error: 1758 SQLSTATE: 35000 (ER\_DA\_INVALID\_CONDITION\_NUMBER)

Message: Invalid condition number

- Error: 1759 SQLSTATE: HY000 (ER\_INSECURE\_PLAIN\_TEXT)

Message: Sending passwords in plain text without SSL/TLS is extremely insecure.

- Error: 1760 SQLSTATE: HY000 (ER\_INSECURE\_CHANGE\_MASTER)

Message: Storing MySQL user name or password information in the master info repository is not secure and is therefore not recommended. Please consider using the USER and PASSWORD connection options for START SLAVE; see the 'START SLAVE Syntax' in the MySQL Manual for more information.

- Error: 1761 SQLSTATE: 23000 (ER\_FOREIGN\_DUPLICATE\_KEY\_WITH\_CHILD\_INFO)

Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in table '%s', key '%s'

- Error: 1762 SQLSTATE: 23000 (ER\_FOREIGN\_DUPLICATE\_KEY\_WITHOUT\_CHILD\_INFO)

Message: Foreign key constraint for table '%s', record '%s' would lead to a duplicate entry in a child table

- Error: 1763 SQLSTATE: HY000 (ER\_SQLTHREAD\_WITH\_SECURE\_SLAVE)

Message: Setting authentication options is not possible when only the Slave SQL Thread is being started.

- Error: 1764 SQLSTATE: HY000 (ER\_TABLE\_HAS\_NO\_FT)

Message: The table does not have FULLTEXT index to support this query

- Error: 1765 SQLSTATE: HY000 (ER\_VARIABLE\_NOT\_SETTABLE\_IN\_SF\_OR\_TRIGGER)

Message: The system variable %s cannot be set in stored functions or triggers.

- Error: 1766 SQLSTATE: HY000 (ER\_VARIABLE\_NOT\_SETTABLE\_IN\_TRANSACTION)

Message: The system variable %s cannot be set when there is an ongoing transaction.

- Error: 1767 SQLSTATE: HY000 (ER\_GTID\_NEXT\_IS\_NOT\_IN\_GTID\_NEXT\_LIST)

Message: The system variable @@SESSION.GTID\_NEXT has the value %s, which is not listed in @@SESSION.GTID\_NEXT\_LIST.

- Error: 1768 SQLSTATE: HY000 (ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION\_WHEN\_GTID\_NEXT\_LIST\_IS\_NULL)

Message: The system variable @@SESSION.GTID\_NEXT cannot change inside a transaction.

ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION\_WHEN\_GTID\_NEXT\_LIST\_IS\_NULL was removed after 5.7.5.

- Error: 1768 SQLSTATE: HY000 (ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION)

Message: The system variable @@SESSION.GTID\_NEXT cannot change inside a transaction.

ER\_CANT\_CHANGE\_GTID\_NEXT\_IN\_TRANSACTION was added in 5.7.6.

- Error: 1769 SQLSTATE: HY000 (ER\_SET\_STATEMENT\_CANNOT\_INVOKE\_FUNCTION)

Message: The statement 'SET %s' cannot invoke a stored function.

- Error: 1770 SQLSTATE: HY000  
(ER\_GTID\_NEXT\_CANT\_BE\_AUTOMATIC\_IF\_GTID\_NEXT\_LIST\_IS\_NON\_NULL)

Message: The system variable @@SESSION.GTID\_NEXT cannot be 'AUTOMATIC' when @@SESSION.GTID\_NEXT\_LIST is non-NULL.

- Error: 1771 SQLSTATE: HY000 (ER\_SKIPPING\_LOGGED\_TRANSACTION)

Message: Skipping transaction %s because it has already been executed and logged.

- Error: 1772 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SET\_SPECIFICATION)

Message: Malformed GTID set specification '%s'.

- Error: 1773 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SET\_ENCODING)

Message: Malformed GTID set encoding.

- Error: 1774 SQLSTATE: HY000 (ER\_MALFORMED\_GTID\_SPECIFICATION)

Message: Malformed GTID specification '%s'.

- Error: 1775 SQLSTATE: HY000 (ER\_GNO\_EXHAUSTED)

Message: Impossible to generate Global Transaction Identifier: the integer component reached the maximal value. Restart the server with a new server\_uuid.

- Error: 1776 SQLSTATE: HY000 (ER\_BAD\_SLAVE\_AUTO\_POSITION)

Message: Parameters MASTER\_LOG\_FILE, MASTER\_LOG\_POS, RELAY\_LOG\_FILE and RELAY\_LOG\_POS cannot be set when MASTER\_AUTO\_POSITION is active.

- Error: 1777 SQLSTATE: HY000 (ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_ON)

Message: CHANGE MASTER TO MASTER\_AUTO\_POSITION = 1 can only be executed when @@GLOBAL.GTID\_MODE = ON.

ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_ON was removed after 5.7.5.

- Error: 1777 SQLSTATE: HY000 (ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_NOT\_OFF)

Message: CHANGE MASTER TO MASTER\_AUTO\_POSITION = 1 cannot be executed because @@GLOBAL.GTID\_MODE = OFF.

ER\_AUTO\_POSITION\_REQUIRES\_GTID\_MODE\_NOT\_OFF was added in 5.7.6.

- Error: 1778 SQLSTATE: HY000  
(ER\_CANT\_DO\_IMPLICIT\_COMMIT\_IN\_TRX\_WHEN\_GTID\_NEXT\_IS\_SET)

Message: Cannot execute statements with implicit commit inside a transaction when @@SESSION.GTID\_NEXT == 'UUID:NUMBER'.

- Error: 1779 SQLSTATE: HY000  
(ER\_GTID\_MODE\_2\_OR\_3\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON)

Message: @@GLOBAL.GTID\_MODE = ON or UPGRADE\_STEP\_2 requires @@GLOBAL.ENFORCE\_GTID\_CONSISTENCY = 1.

ER\_GTID\_MODE\_2\_OR\_3\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON was removed after 5.7.5.

- Error: 1779 SQLSTATE: HY000 (ER\_GTID\_MODE\_ON\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON)

Message: GTID\_MODE = ON requires ENFORCE\_GTID\_CONSISTENCY = ON.

ER\_GTID\_MODE\_ON\_REQUIRES\_ENFORCE\_GTID\_CONSISTENCY\_ON was added in 5.7.6.

- Error: 1780 SQLSTATE: HY000 (ER\_GTID\_MODE\_REQUIRES\_BINLOG)

Message: @@GLOBAL.GTID\_MODE = ON or ON\_PERMISSIVE or OFF\_PERMISSIVE requires --log-bin and --log-slave-updates.

- Error: 1781 SQLSTATE: HY000 (ER\_CANT\_SET\_GTID\_NEXT\_TO\_GTID\_WHEN\_GTID\_MODE\_IS\_OFF)

Message: @@SESSION.GTID\_NEXT cannot be set to UUID:NUMBER when @@GLOBAL.GTID\_MODE = OFF.

- Error: 1782 SQLSTATE: HY000 (ER\_CANT\_SET\_GTID\_NEXT\_TO\_ANONYMOUS\_WHEN\_GTID\_MODE\_IS\_ON)

Message: @@SESSION.GTID\_NEXT cannot be set to ANONYMOUS when @@GLOBAL.GTID\_MODE = ON.

- Error: 1783 SQLSTATE: HY000 (ER\_CANT\_SET\_GTID\_NEXT\_LIST\_TO\_NON\_NULL\_WHEN\_GTID\_MODE\_IS\_OFF)

Message: @@SESSION.GTID\_NEXT\_LIST cannot be set to a non-NULL value when @@GLOBAL.GTID\_MODE = OFF.

- Error: 1784 SQLSTATE: HY000 (ER\_FOUND\_GTID\_EVENT\_WHEN\_GTID\_MODE\_IS\_OFF)

Message: Found a Gtid\_log\_event or Previous\_gtids\_log\_event when @@GLOBAL.GTID\_MODE = OFF.

ER\_FOUND\_GTID\_EVENT\_WHEN\_GTID\_MODE\_IS\_OFF was removed after 5.7.5.

- Error: 1784 SQLSTATE: HY000 (ER\_FOUND\_GTID\_EVENT\_WHEN\_GTID\_MODE\_IS\_OFF\_\_UNUSED)

Message: Found a Gtid\_log\_event when @@GLOBAL.GTID\_MODE = OFF.

ER\_FOUND\_GTID\_EVENT\_WHEN\_GTID\_MODE\_IS\_OFF\_\_UNUSED was added in 5.7.6.

- Error: 1785 SQLSTATE: HY000 (ER\_GTID\_UNSAFE\_NON\_TRANSACTIONAL\_TABLE)

Message: Statement violates GTID consistency: Updates to non-transactional tables can only be done in either autocommitted statements or single-statement transactions, and never in the same statement as updates to transactional tables.

- Error: 1786 SQLSTATE: HY000 (ER\_GTID\_UNSAFE\_CREATE\_SELECT)

Message: Statement violates GTID consistency: CREATE TABLE ... SELECT.

- Error: 1787 SQLSTATE: HY000 (ER\_GTID\_UNSAFE\_CREATE\_DROP\_TEMPORARY\_TABLE\_IN\_TRANSACTION)

Message: Statement violates GTID consistency: CREATE TEMPORARY TABLE and DROP TEMPORARY TABLE can only be executed outside transactional context. These statements are also not allowed in a function or trigger because functions and triggers are also considered to be multi-statement transactions.

- Error: 1788 SQLSTATE: HY000 (ER\_GTID\_MODE\_CAN\_ONLY\_CHANGE\_ONE\_STEP\_AT\_A\_TIME)

Message: The value of @@GLOBAL.GTID\_MODE can only be changed one step at a time: OFF <-> OFF\_PERMISSIVE <-> ON\_PERMISSIVE <-> ON. Also note that this value must be stepped up or down simultaneously on all servers. See the Manual for instructions.

- Error: 1789 SQLSTATE: HY000 (ER\_MASTER\_HAS\_PURGED\_REQUIRED\_GTIDS)

Message: The slave is connecting using CHANGE MASTER TO MASTER\_AUTO\_POSITION = 1, but the master has purged binary logs containing GTIDs that the slave requires.

- Error: 1790 SQLSTATE: HY000 (ER\_CANT\_SET\_GTID\_NEXT\_WHEN\_OWNING\_GTID)

Message: @@SESSION.GTID\_NEXT cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

- Error: 1791 SQLSTATE: HY000 (ER\_UNKNOWN\_EXPLAIN\_FORMAT)

Message: Unknown EXPLAIN format name: '%s'

- Error: 1792 SQLSTATE: 25006 (ER\_CANT\_EXECUTE\_IN\_READ\_ONLY\_TRANSACTION)

Message: Cannot execute statement in a READ ONLY transaction.

- Error: 1793 SQLSTATE: HY000 (ER\_TOO\_LONG\_TABLE\_PARTITION\_COMMENT)

Message: Comment for table partition '%s' is too long (max = %lu)

- Error: 1794 SQLSTATE: HY000 (ER\_SLAVE\_CONFIGURATION)

Message: Slave is not configured or failed to initialize properly. You must at least set --server-id to enable either a master or a slave. Additional error messages can be found in the MySQL error log.

- Error: 1795 SQLSTATE: HY000 (ER\_INNODB\_FT\_LIMIT)

Message: InnoDB presently supports one FULLTEXT index creation at a time

- Error: 1796 SQLSTATE: HY000 (ER\_INNODB\_NO\_FT\_TEMP\_TABLE)

Message: Cannot create FULLTEXT index on temporary InnoDB table

- Error: 1797 SQLSTATE: HY000 (ER\_INNODB\_FT\_WRONG\_DOCID\_COLUMN)

Message: Column '%s' is of wrong type for an InnoDB FULLTEXT index

- Error: 1798 SQLSTATE: HY000 (ER\_INNODB\_FT\_WRONG\_DOCID\_INDEX)

Message: Index '%s' is of wrong type for an InnoDB FULLTEXT index

- Error: 1799 SQLSTATE: HY000 (ER\_INNODB\_ONLINE\_LOG\_TOO\_BIG)

Message: Creating index '%s' required more than 'innodb\_online\_alter\_log\_max\_size' bytes of modification log. Please try again.

- Error: 1800 SQLSTATE: HY000 (ER\_UNKNOWN\_ALTER\_ALGORITHM)

Message: Unknown ALGORITHM '%s'

- Error: 1801 SQLSTATE: HY000 (ER\_UNKNOWN\_ALTER\_LOCK)  
Message: Unknown LOCK type '%s'
- Error: 1802 SQLSTATE: HY000 (ER\_MTS\_CHANGE\_MASTER\_CANT\_RUN\_WITH\_GAPS)  
Message: CHANGE MASTER cannot be executed when the slave was stopped with an error or killed in MTS mode. Consider using RESET SLAVE or START SLAVE UNTIL.
- Error: 1803 SQLSTATE: HY000 (ER\_MTS\_RECOVERY\_FAILURE)  
Message: Cannot recover after SLAVE errored out in parallel execution mode. Additional error messages can be found in the MySQL error log.
- Error: 1804 SQLSTATE: HY000 (ER\_MTS\_RESET\_WORKERS)  
Message: Cannot clean up worker info tables. Additional error messages can be found in the MySQL error log.
- Error: 1805 SQLSTATE: HY000 (ER\_COL\_COUNT\_DOESNT\_MATCH\_CORRUPTED\_V2)  
Message: Column count of %s.%s is wrong. Expected %d, found %d. The table is probably corrupted
- Error: 1806 SQLSTATE: HY000 (ER\_SLAVE\_SILENT\_RETRY\_TRANSACTION)  
Message: Slave must silently retry current transaction
- Error: 1807 SQLSTATE: HY000 (ER\_DISCARD\_FK\_CHECKS\_RUNNING)  
Message: There is a foreign key check running on table '%s'. Cannot discard the table.
- Error: 1808 SQLSTATE: HY000 (ER\_TABLE\_SCHEMA\_MISMATCH)  
Message: Schema mismatch (%s)
- Error: 1809 SQLSTATE: HY000 (ER\_TABLE\_IN\_SYSTEM\_TABLESPACE)  
Message: Table '%s' in system tablespace
- Error: 1810 SQLSTATE: HY000 (ER\_IO\_READ\_ERROR)  
Message: IO Read error: (%lu, %s) %s
- Error: 1811 SQLSTATE: HY000 (ER\_IO\_WRITE\_ERROR)  
Message: IO Write error: (%lu, %s) %s
- Error: 1812 SQLSTATE: HY000 (ER\_TABLESPACE\_MISSING)  
Message: Tablespace is missing for table %s.
- Error: 1813 SQLSTATE: HY000 (ER\_TABLESPACE\_EXISTS)  
Message: Tablespace '%s' exists.
- Error: 1814 SQLSTATE: HY000 (ER\_TABLESPACE\_DISCARDED)  
Message: Tablespace has been discarded for table '%s'
- Error: 1815 SQLSTATE: HY000 (ER\_INTERNAL\_ERROR)  
Message: Internal error: %s

- Error: 1816 SQLSTATE: HY000 (ER\_INNODB\_IMPORT\_ERROR)  
Message: ALTER TABLE %s IMPORT TABLESPACE failed with error %lu : '%s'
- Error: 1817 SQLSTATE: HY000 (ER\_INNODB\_INDEX\_CORRUPT)  
Message: Index corrupt: %s
- Error: 1818 SQLSTATE: HY000 (ER\_INVALID\_YEAR\_COLUMN\_LENGTH)  
Message: Supports only YEAR or YEAR(4) column.
- Error: 1819 SQLSTATE: HY000 (ER\_NOT\_VALID\_PASSWORD)  
Message: Your password does not satisfy the current policy requirements
- Error: 1820 SQLSTATE: HY000 (ER\_MUST\_CHANGE\_PASSWORD)  
Message: You must reset your password using ALTER USER statement before executing this statement.
- Error: 1821 SQLSTATE: HY000 (ER\_FK\_NO\_INDEX\_CHILD)  
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the foreign table '%s'
- Error: 1822 SQLSTATE: HY000 (ER\_FK\_NO\_INDEX\_PARENT)  
Message: Failed to add the foreign key constraint. Missing index for constraint '%s' in the referenced table '%s'
- Error: 1823 SQLSTATE: HY000 (ER\_FK\_FAIL\_ADD\_SYSTEM)  
Message: Failed to add the foreign key constraint '%s' to system tables
- Error: 1824 SQLSTATE: HY000 (ER\_FK\_CANNOT\_OPEN\_PARENT)  
Message: Failed to open the referenced table '%s'
- Error: 1825 SQLSTATE: HY000 (ER\_FK\_INCORRECT\_OPTION)  
Message: Failed to add the foreign key constraint on table '%s'. Incorrect options in FOREIGN KEY constraint '%s'
- Error: 1826 SQLSTATE: HY000 (ER\_FK\_DUP\_NAME)  
Message: Duplicate foreign key constraint name '%s'
- Error: 1827 SQLSTATE: HY000 (ER\_PASSWORD\_FORMAT)  
Message: The password hash doesn't have the expected format. Check if the correct password algorithm is being used with the PASSWORD() function.
- Error: 1828 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_DROP)  
Message: Cannot drop column '%s': needed in a foreign key constraint '%s'
- Error: 1829 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_DROP\_CHILD)  
Message: Cannot drop column '%s': needed in a foreign key constraint '%s' of table '%s'
- Error: 1830 SQLSTATE: HY000 (ER\_FK\_COLUMN\_NOT\_NULL)  
Message: Column '%s' cannot be NOT NULL: needed in a foreign key constraint '%s' SET NULL

- Error: 1831 SQLSTATE: HY000 (ER\_DUP\_INDEX)  
 Message: Duplicate index '%s' defined on the table '%s.%s'. This is deprecated and will be disallowed in a future release.
- Error: 1832 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_CHANGE)  
 Message: Cannot change column '%s': used in a foreign key constraint '%s'
- Error: 1833 SQLSTATE: HY000 (ER\_FK\_COLUMN\_CANNOT\_CHANGE\_CHILD)  
 Message: Cannot change column '%s': used in a foreign key constraint '%s' of table '%s'
- Error: 1834 SQLSTATE: HY000 (ER\_FK\_CANNOT\_DELETE\_PARENT)  
 Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'  
 ER\_FK\_CANNOT\_DELETE\_PARENT was removed after 5.7.3.
- Error: 1834 SQLSTATE: HY000 (ER\_UNUSED5)  
 Message: Cannot delete rows from table which is parent in a foreign key constraint '%s' of table '%s'  
 ER\_UNUSED5 was added in 5.7.4.
- Error: 1835 SQLSTATE: HY000 (ER\_MALFORMED\_PACKET)  
 Message: Malformed communication packet.
- Error: 1836 SQLSTATE: HY000 (ER\_READ\_ONLY\_MODE)  
 Message: Running in read-only mode
- Error: 1837 SQLSTATE: HY000 (ER\_GTID\_NEXT\_TYPE\_UNDEFINED\_GROUP)  
 Message: When @@SESSION.GTID\_NEXT is set to a GTID, you must explicitly set it to a different value after a COMMIT or ROLLBACK. Please check GTID\_NEXT variable manual page for detailed explanation. Current @@SESSION.GTID\_NEXT is '%s'.
- Error: 1838 SQLSTATE: HY000 (ER\_VARIABLE\_NOT\_SETTABLE\_IN\_SP)  
 Message: The system variable %s cannot be set in stored procedures.
- Error: 1839 SQLSTATE: HY000 (ER\_CANT\_SET\_GTID\_PURGED\_WHEN\_GTID\_MODE\_IS\_OFF)  
 Message: @@GLOBAL.GTID\_PURGED can only be set when @@GLOBAL.GTID\_MODE = ON.
- Error: 1840 SQLSTATE: HY000  
 (ER\_CANT\_SET\_GTID\_PURGED\_WHEN\_GTID\_EXECUTED\_IS\_NOT\_EMPTY)  
 Message: @@GLOBAL.GTID\_PURGED can only be set when @@GLOBAL.GTID\_EXECUTED is empty.
- Error: 1841 SQLSTATE: HY000  
 (ER\_CANT\_SET\_GTID\_PURGED\_WHEN\_OWNED\_GTIDS\_IS\_NOT\_EMPTY)  
 Message: @@GLOBAL.GTID\_PURGED can only be set when there are no ongoing transactions (not even in other clients).
- Error: 1842 SQLSTATE: HY000 (ER\_GTID\_PURGED\_WAS\_CHANGED)  
 Message: @@GLOBAL.GTID\_PURGED was changed from '%s' to '%s'.
- Error: 1843 SQLSTATE: HY000 (ER\_GTID\_EXECUTED\_WAS\_CHANGED)

Message: @@GLOBAL.GTID\_EXECUTED was changed from '%s' to '%s'.

- Error: 1844 SQLSTATE: HY000 (ER\_BINLOG\_STMT\_MODE\_AND\_NO\_REPL\_TABLES)

Message: Cannot execute statement: impossible to write to binary log since BINLOG\_FORMAT = STATEMENT, and both replicated and non replicated tables are written to.

- Error: 1845 SQLSTATE: 0A000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED)

Message: %s is not supported for this operation. Try %s.

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED was added in 5.7.1.

- Error: 1846 SQLSTATE: 0A000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON)

Message: %s is not supported. Reason: %s. Try %s.

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON was added in 5.7.1.

- Error: 1847 SQLSTATE: HY000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_COPY)

Message: COPY algorithm requires a lock

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_COPY was added in 5.7.1.

- Error: 1848 SQLSTATE: HY000  
(ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_PARTITION)

Message: Partition specific operations do not yet support LOCK/ALGORITHM

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_PARTITION was added in 5.7.1.

- Error: 1849 SQLSTATE: HY000  
(ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_FK\_RENAME)

Message: Columns participating in a foreign key are renamed

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_FK\_RENAME was added in 5.7.1.

- Error: 1850 SQLSTATE: HY000  
(ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_COLUMN\_TYPE)

Message: Cannot change column type INPLACE

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_COLUMN\_TYPE was added in 5.7.1.

- Error: 1851 SQLSTATE: HY000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_FK\_CHECK)

Message: Adding foreign keys needs foreign\_key\_checks=OFF

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_FK\_CHECK was added in 5.7.1.

- Error: 1852 SQLSTATE: HY000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_IGNORE)

Message: Creating unique indexes with IGNORE requires COPY algorithm to remove duplicate rows

ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_IGNORE was added in 5.7.1, removed after 5.7.3.

- Error: 1852 SQLSTATE: HY000 (ER\_UNUSED6)

Message: Creating unique indexes with IGNORE requires COPY algorithm to remove duplicate rows

[ER\\_UNUSED6](#) was added in 5.7.4.

- Error: 1853 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOPK](#))

Message: Dropping a primary key is not allowed without also adding a new primary key

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOPK](#) was added in 5.7.1.

- Error: 1854 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_AUTOINC](#))

Message: Adding an auto-increment column requires a lock

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_AUTOINC](#) was added in 5.7.1.

- Error: 1855 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_HIDDEN\\_FTS](#))

Message: Cannot replace hidden FTS\_DOC\_ID with a user-visible one

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_HIDDEN\\_FTS](#) was added in 5.7.1.

- Error: 1856 SQLSTATE: HY000  
([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_CHANGE\\_FTS](#))

Message: Cannot drop or rename FTS\_DOC\_ID

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_CHANGE\\_FTS](#) was added in 5.7.1.

- Error: 1857 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FTS](#))

Message: Fulltext index creation requires a lock

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_FTS](#) was added in 5.7.1.

- Error: 1858 SQLSTATE: HY000  
([ER\\_SQL\\_SLAVE\\_SKIP\\_COUNTER\\_NOT\\_SETTABLE\\_IN\\_GTID\\_MODE](#))

Message: sql\_slave\_skip\_counter can not be set when the server is running with @@GLOBAL.GTID\_MODE = ON. Instead, for each transaction that you want to skip, generate an empty transaction with the same GTID as the transaction

[ER\\_SQL\\_SLAVE\\_SKIP\\_COUNTER\\_NOT\\_SETTABLE\\_IN\\_GTID\\_MODE](#) was added in 5.7.1.

- Error: 1859 SQLSTATE: 23000 ([ER\\_DUP\\_UNKNOWN\\_IN\\_INDEX](#))

Message: Duplicate entry for key '%s'

[ER\\_DUP\\_UNKNOWN\\_IN\\_INDEX](#) was added in 5.7.1.

- Error: 1860 SQLSTATE: HY000 ([ER\\_IDENT\\_CAUSES\\_TOO\\_LONG\\_PATH](#))

Message: Long database name and identifier for object resulted in path length exceeding %d characters. Path: '%s'.

[ER\\_IDENT\\_CAUSES\\_TOO\\_LONG\\_PATH](#) was added in 5.7.1.

- Error: 1861 SQLSTATE: HY000 ([ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOT\\_NULL](#))

Message: cannot silently convert NULL values, as required in this SQL\_MODE

[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_NOT\\_NULL](#) was added in 5.7.1.

- Error: 1862 SQLSTATE: HY000 ([ER\\_MUST\\_CHANGE\\_PASSWORD\\_LOGIN](#))

Message: Your password has expired. To log in you must change it using a client that supports expired passwords.

`ER_MUST_CHANGE_PASSWORD_LOGIN` was added in 5.7.1.

- Error: 1863 SQLSTATE: HY000 (`ER_ROW_IN_WRONG_PARTITION`)

Message: Found a row in wrong partition %s

`ER_ROW_IN_WRONG_PARTITION` was added in 5.7.1.

- Error: 1864 SQLSTATE: HY000 (`ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX`)

Message: Cannot schedule event %s, relay-log name %s, position %s to Worker thread because its size %lu exceeds %lu of slave\_pending\_jobs\_size\_max.

`ER_MTS_EVENT_BIGGER_PENDING_JOBS_SIZE_MAX` was added in 5.7.2.

- Error: 1865 SQLSTATE: HY000 (`ER_INNO_DB_NO_FT_USES_PARSER`)

Message: Cannot CREATE FULLTEXT INDEX WITH PARSE on InnoDB table

`ER_INNO_DB_NO_FT_USES_PARSER` was added in 5.7.2.

- Error: 1866 SQLSTATE: HY000 (`ER_BINLOG_LOGICAL_CORRUPTION`)

Message: The binary log file '%s' is logically corrupted: %s

`ER_BINLOG_LOGICAL_CORRUPTION` was added in 5.7.2.

- Error: 1867 SQLSTATE: HY000 (`ER_WARN_PURGE_LOG_IN_USE`)

Message: file %s was not purged because it was being read by %d thread(s), purged only %d out of %d files.

`ER_WARN_PURGE_LOG_IN_USE` was added in 5.7.2.

- Error: 1868 SQLSTATE: HY000 (`ER_WARN_PURGE_LOG_IS_ACTIVE`)

Message: file %s was not purged because it is the active log file.

`ER_WARN_PURGE_LOG_IS_ACTIVE` was added in 5.7.2.

- Error: 1869 SQLSTATE: HY000 (`ER_AUTO_INCREMENT_CONFLICT`)

Message: Auto-increment value in UPDATE conflicts with internally generated values

`ER_AUTO_INCREMENT_CONFLICT` was added in 5.7.2.

- Error: 1870 SQLSTATE: HY000 (`WARN_ON_BLOCKHOLE_IN_RBR`)

Message: Row events are not logged for %s statements that modify BLACKHOLE tables in row format. Table(s): '%s'

`WARN_ON_BLOCKHOLE_IN_RBR` was added in 5.7.2.

- Error: 1871 SQLSTATE: HY000 (`ER_SLAVE_MI_INIT_REPOSITORY`)

Message: Slave failed to initialize master info structure from the repository

`ER_SLAVE_MI_INIT_REPOSITORY` was added in 5.7.2.

- Error: 1872 SQLSTATE: HY000 (`ER_SLAVE_RLI_INIT_REPOSITORY`)

Message: Slave failed to initialize relay log info structure from the repository

[ER\\_SLAVE\\_RLI\\_INIT\\_REPOSITORY](#) was added in 5.7.2.

- Error: [1873](#) SQLSTATE: [28000](#) ([ER\\_ACCESS\\_DENIED\\_CHANGE\\_USER\\_ERROR](#))

Message: Access denied trying to change to user '%s'@'%s' (using password: %s). Disconnecting.

[ER\\_ACCESS\\_DENIED\\_CHANGE\\_USER\\_ERROR](#) was added in 5.7.2.

- Error: [1874](#) SQLSTATE: [HY000](#) ([ER\\_INNODB\\_READ\\_ONLY](#))

Message: InnoDB is in read only mode.

[ER\\_INNODB\\_READ\\_ONLY](#) was added in 5.7.2.

- Error: [1875](#) SQLSTATE: [HY000](#) ([ER\\_STOP\\_SLAVE\\_SQL\\_THREAD\\_TIMEOUT](#))

Message: STOP SLAVE command execution is incomplete: Slave SQL thread got the stop signal, thread is busy, SQL thread will stop once the current task is complete.

[ER\\_STOP\\_SLAVE\\_SQL\\_THREAD\\_TIMEOUT](#) was added in 5.7.2.

- Error: [1876](#) SQLSTATE: [HY000](#) ([ER\\_STOP\\_SLAVE\\_IO\\_THREAD\\_TIMEOUT](#))

Message: STOP SLAVE command execution is incomplete: Slave IO thread got the stop signal, thread is busy, IO thread will stop once the current task is complete.

[ER\\_STOP\\_SLAVE\\_IO\\_THREAD\\_TIMEOUT](#) was added in 5.7.2.

- Error: [1877](#) SQLSTATE: [HY000](#) ([ER\\_TABLE\\_CORRUPT](#))

Message: Operation cannot be performed. The table '%s.%s' is missing, corrupt or contains bad data.

[ER\\_TABLE\\_CORRUPT](#) was added in 5.7.2.

- Error: [1878](#) SQLSTATE: [HY000](#) ([ER\\_TEMP\\_FILE\\_WRITE\\_FAILURE](#))

Message: Temporary file write failure.

[ER\\_TEMP\\_FILE\\_WRITE\\_FAILURE](#) was added in 5.7.3.

- Error: [1879](#) SQLSTATE: [HY000](#) ([ER\\_INNODB\\_FT\\_AUX\\_NOT\\_HEX\\_ID](#))

Message: Upgrade index name failed, please use create index(alter table) algorithm copy to rebuild index.

[ER\\_INNODB\\_FT\\_AUX\\_NOT\\_HEX\\_ID](#) was added in 5.7.4.

- Error: [1880](#) SQLSTATE: [HY000](#) ([ER\\_OLD\\_TEMPORALS\\_UPGRADED](#))

Message: TIME/TIMESTAMP/DATETIME columns of old format have been upgraded to the new format.

[ER\\_OLD\\_TEMPORALS\\_UPGRADED](#) was added in 5.7.4.

- Error: [1881](#) SQLSTATE: [HY000](#) ([ER\\_INNODB\\_FORCED\\_RECOVERY](#))

Message: Operation not allowed when innodb\_forced\_recovery > 0.

[ER\\_INNODB\\_FORCED\\_RECOVERY](#) was added in 5.7.4.

- Error: 1882 SQLSTATE: HY000 (ER\_AES\_INVALID\_IV)

Message: The initialization vector supplied to %s is too short. Must be at least %d bytes long

ER\_AES\_INVALID\_IV was added in 5.7.4.
- Error: 1883 SQLSTATE: HY000 (ER\_PLUGIN\_CANNOT\_BE\_UNINSTALLED)

Message: Plugin '%s' cannot be uninstalled now. %s

ER\_PLUGIN\_CANNOT\_BE\_UNINSTALLED was added in 5.7.5.
- Error: 1884 SQLSTATE: HY000  
(ER\_GTID\_UNSAFE\_BINLOG\_SPLITTABLE\_STATEMENT\_AND\_GTID\_GROUP)

Message: Cannot execute statement because it needs to be written to the binary log as multiple statements, and this is not allowed when @@SESSION.GTID\_NEXT == 'UUID:NUMBER'.

ER\_GTID\_UNSAFE\_BINLOG\_SPLITTABLE\_STATEMENT\_AND\_GTID\_GROUP was added in 5.7.5.
- Error: 1885 SQLSTATE: HY000 (ER\_SLAVE\_HAS\_MORE\_GTIDS\_THAN\_MASTER)

Message: Slave has more GTIDs than the master has, using the master's SERVER\_UUID. This may indicate that the end of the binary log was truncated or that the last binary log file was lost, e.g., after a power or disk failure when sync\_binlog != 1. The master may or may not have rolled back transactions that were already replicated to the slave. Suggest to replicate any transactions that master has rolled back from slave to master, and/or commit empty transactions on master to account for transactions that have been committed on master but are not included in GTID\_EXECUTED.

ER\_SLAVE\_HAS\_MORE\_GTIDS\_THAN\_MASTER was added in 5.7.6.
- Error: 1886 SQLSTATE: HY000 (ER\_MISSING\_KEY)

Message: The table '%s.%s' does not have the necessary key(s) defined on it. Please check the table definition and create index(s) accordingly.

ER\_MISSING\_KEY was added in 5.7.22.
- Error: 1906 SQLSTATE: HY000 (ER\_SLAVE\_IO\_THREAD\_MUST\_STOP)

Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO\_THREAD first.

ER\_SLAVE\_IO\_THREAD\_MUST\_STOP was added in 5.7.4, removed after 5.7.5.
- Error: 3000 SQLSTATE: HY000 (ER\_FILE\_CORRUPT)

Message: File %s is corrupted
- Error: 3001 SQLSTATE: HY000 (ER\_ERROR\_ON\_MASTER)

Message: Query partially completed on the master (error on master: %d) and was aborted. There is a chance that your master is inconsistent at this point. If you are sure that your master is ok, run this query manually on the slave and then restart the slave with SET GLOBAL SQL\_SLAVE\_SKIP\_COUNTER=1; START SLAVE;. Query: '%s'
- Error: 3002 SQLSTATE: HY000 (ER\_INCONSISTENT\_ERROR)

Message: Query caused different errors on master and slave. Error on master: message (format)='%s' error code=%d; Error on slave: actual message='%s', error code=%d. Default database: '%s'. Query: '%s'
- Error: 3003 SQLSTATE: HY000 (ER\_STORAGE\_ENGINE\_NOT\_LOADED)

Message: Storage engine for table '%s'.'%s' is not loaded.

- Error: 3004 SQLSTATE: 0Z002 ([ER\\_GET\\_STACKED\\_DA\\_WITHOUT\\_ACTIVE\\_HANDLER](#))

Message: GET STACKED DIAGNOSTICS when handler not active

- Error: 3005 SQLSTATE: HY000 ([ER\\_WARN\\_LEGACY\\_SYNTAX\\_CONVERTED](#))

Message: %s is no longer supported. The statement was converted to %s.

- Error: 3006 SQLSTATE: HY000 ([ER\\_BINLOG\\_UNSAFE\\_FULLTEXT\\_PLUGIN](#))

Message: Statement is unsafe because it uses a fulltext parser plugin which may not return the same value on the slave.

[ER\\_BINLOG\\_UNSAFE\\_FULLTEXT\\_PLUGIN](#) was added in 5.7.1.

- Error: 3007 SQLSTATE: HY000 ([ER\\_CANNOT\\_DISCARD\\_TEMPORARY\\_TABLE](#))

Message: Cannot DISCARD/IMPORT tablespace associated with temporary table

[ER\\_CANNOT\\_DISCARD\\_TEMPORARY\\_TABLE](#) was added in 5.7.1.

- Error: 3008 SQLSTATE: HY000 ([ER\\_FK\\_DEPTH\\_EXCEEDED](#))

Message: Foreign key cascade delete/update exceeds max depth of %d.

[ER\\_FK\\_DEPTH\\_EXCEEDED](#) was added in 5.7.2.

- Error: 3009 SQLSTATE: HY000 ([ER\\_COL\\_COUNT\\_DOESNT\\_MATCH\\_PLEASE\\_UPDATE\\_V2](#))

Message: Column count of %s.%s is wrong. Expected %d, found %d. Created with MySQL %d, now running %d. Please use mysql\_upgrade to fix this error.

[ER\\_COL\\_COUNT\\_DOESNT\\_MATCH\\_PLEASE\\_UPDATE\\_V2](#) was added in 5.7.2.

- Error: 3010 SQLSTATE: HY000 ([ER\\_WARN\\_TRIGGER\\_DOESNT\\_HAVE\\_CREATED](#))

Message: Trigger %s.%s.%s does not have CREATED attribute.

[ER\\_WARN\\_TRIGGER\\_DOESNT\\_HAVE\\_CREATED](#) was added in 5.7.2.

- Error: 3011 SQLSTATE: HY000 ([ER\\_REFERENCED\\_TRG\\_DOES\\_NOT\\_EXIST](#))

Message: Referenced trigger '%s' for the given action time and event type does not exist.

[ER\\_REFERENCED\\_TRG\\_DOES\\_NOT\\_EXIST](#) was added in 5.7.2.

- Error: 3012 SQLSTATE: HY000 ([ER\\_EXPLAIN\\_NOT\\_SUPPORTED](#))

Message: EXPLAIN FOR CONNECTION command is supported only for SELECT/UPDATE/INSERT/DELETE/REPLACE

[ER\\_EXPLAIN\\_NOT\\_SUPPORTED](#) was added in 5.7.2.

- Error: 3013 SQLSTATE: HY000 ([ER\\_INVALID\\_FIELD\\_SIZE](#))

Message: Invalid size for column '%s'.

[ER\\_INVALID\\_FIELD\\_SIZE](#) was added in 5.7.2.

- Error: 3014 SQLSTATE: HY000 ([ER\\_MISSING\\_HA\\_CREATE\\_OPTION](#))

Message: Table storage engine '%s' found required create option missing

`ER_MISSING_HA_CREATE_OPTION` was added in 5.7.2.

- Error: 3015 SQLSTATE: HY000 (`ER_ENGINE_OUT_OF_MEMORY`)

Message: Out of memory in storage engine '%s'.

`ER_ENGINE_OUT_OF_MEMORY` was added in 5.7.3.

- Error: 3016 SQLSTATE: HY000 (`ER_PASSWORD_EXPIRE_ANONYMOUS_USER`)

Message: The password for anonymous user cannot be expired.

`ER_PASSWORD_EXPIRE_ANONYMOUS_USER` was added in 5.7.3.

- Error: 3017 SQLSTATE: HY000 (`ER_SLAVE_SQL_THREAD_MUST_STOP`)

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL\_THREAD first

`ER_SLAVE_SQL_THREAD_MUST_STOP` was added in 5.7.3.

- Error: 3018 SQLSTATE: HY000 (`ER_NO_FT_MATERIALIZED_SUBQUERY`)

Message: Cannot create FULLTEXT index on materialized subquery

`ER_NO_FT_MATERIALIZED_SUBQUERY` was added in 5.7.4.

- Error: 3019 SQLSTATE: HY000 (`ER_INNODB_UNDO_LOG_FULL`)

Message: Undo Log error: %s

`ER_INNODB_UNDO_LOG_FULL` was added in 5.7.4.

- Error: 3020 SQLSTATE: 2201E (`ER_INVALID_ARGUMENT_FOR_LOGARITHM`)

Message: Invalid argument for logarithm

`ER_INVALID_ARGUMENT_FOR_LOGARITHM` was added in 5.7.4.

- Error: 3021 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP`)

Message: This operation cannot be performed with a running slave io thread; run STOP SLAVE IO\_THREAD FOR CHANNEL '%s' first.

`ER_SLAVE_CHANNEL_IO_THREAD_MUST_STOP` was added in 5.7.6.

- Error: 3022 SQLSTATE: HY000 (`ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO`)

Message: This operation may not be safe when the slave has temporary tables. The tables will be kept open until the server restarts or until the tables are deleted by any replicated DROP statement. Suggest to wait until slave\_open\_temp\_tables = 0.

`ER_WARN_OPEN_TEMP_TABLES_MUST_BE_ZERO` was added in 5.7.4.

- Error: 3023 SQLSTATE: HY000 (`ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS`)

Message: CHANGE MASTER TO with a MASTER\_LOG\_FILE clause but no MASTER\_LOG\_POS clause may not be safe. The old position value may not be valid for the new binary log file.

`ER_WARN_ONLY_MASTER_LOG_FILE_NO_POS` was added in 5.7.4.

- Error: 3024 SQLSTATE: HY000 (`ER_QUERY_TIMEOUT`)

Message: Query execution was interrupted, maximum statement execution time exceeded

[ER\\_QUERY\\_TIMEOUT](#) was added in 5.7.4.

- Error: 3025 SQLSTATE: HY000 ([ER\\_NON\\_RO\\_SELECT\\_DISABLE\\_TIMER](#))

Message: Select is not a read only statement, disabling timer

[ER\\_NON\\_RO\\_SELECT\\_DISABLE\\_TIMER](#) was added in 5.7.4.

- Error: 3026 SQLSTATE: HY000 ([ER\\_DUP\\_LIST\\_ENTRY](#))

Message: Duplicate entry '%s'.

[ER\\_DUP\\_LIST\\_ENTRY](#) was added in 5.7.4.

- Error: 3027 SQLSTATE: HY000 ([ER\\_SQL\\_MODE\\_NO\\_EFFECT](#))

Message: '%s' mode no longer has any effect. Use STRICT\_ALL\_TABLES or STRICT\_TRANS\_TABLES instead.

[ER\\_SQL\\_MODE\\_NO\\_EFFECT](#) was added in 5.7.4.

- Error: 3028 SQLSTATE: HY000 ([ER\\_AGGREGATE\\_ORDER\\_FOR\\_UNION](#))

Message: Expression #%u of ORDER BY contains aggregate function and applies to a UNION

[ER\\_AGGREGATE\\_ORDER\\_FOR\\_UNION](#) was added in 5.7.5.

- Error: 3029 SQLSTATE: HY000 ([ER\\_AGGREGATE\\_ORDER\\_NON\\_AGG\\_QUERY](#))

Message: Expression #%u of ORDER BY contains aggregate function and applies to the result of a non-aggregated query

[ER\\_AGGREGATE\\_ORDER\\_NON\\_AGG\\_QUERY](#) was added in 5.7.5.

- Error: 3030 SQLSTATE: HY000 ([ER\\_SLAVE\\_WORKER\\_STOPPED\\_PREVIOUS\\_THD\\_ERROR](#))

Message: Slave worker has stopped after at least one previous worker encountered an error when slave-preserve-commit-order was enabled. To preserve commit order, the last transaction executed by this thread has not been committed. When restarting the slave after fixing any failed threads, you should fix this worker as well.

[ER\\_SLAVE\\_WORKER\\_STOPPED\\_PREVIOUS\\_THD\\_ERROR](#) was added in 5.7.5.

- Error: 3031 SQLSTATE: HY000 ([ER\\_DONT\\_SUPPORT\\_SLAVE\\_PRESERVE\\_COMMIT\\_ORDER](#))

Message: slave\_preserve\_commit\_order is not supported %s.

[ER\\_DONT\\_SUPPORT\\_SLAVE\\_PRESERVE\\_COMMIT\\_ORDER](#) was added in 5.7.5.

- Error: 3032 SQLSTATE: HY000 ([ER\\_SERVER\\_OFFLINE\\_MODE](#))

Message: The server is currently in offline mode

[ER\\_SERVER\\_OFFLINE\\_MODE](#) was added in 5.7.5.

- Error: 3033 SQLSTATE: HY000 ([ER\\_GIS\\_DIFFERENT\\_SRIDS](#))

Message: Binary geometry function %s given two geometries of different srids: %u and %u, which should have been identical.

Geometry values passed as arguments to spatial functions must have the same SRID value.

`ER_GIS_DIFFERENT_SRIDS` was added in 5.7.5.

- Error: 3034 SQLSTATE: HY000 (`ER_GIS_UNSUPPORTED_ARGUMENT`)

Message: Calling geometry function %s with unsupported types of arguments.

A spatial function was called with a combination of argument types that the function does not support.

`ER_GIS_UNSUPPORTED_ARGUMENT` was added in 5.7.5.

- Error: 3035 SQLSTATE: HY000 (`ER_GIS_UNKNOWN_ERROR`)

Message: Unknown GIS error occurred in function %s.

`ER_GIS_UNKNOWN_ERROR` was added in 5.7.5.

- Error: 3036 SQLSTATE: HY000 (`ER_GIS_UNKNOWN_EXCEPTION`)

Message: Unknown exception caught in GIS function %s.

`ER_GIS_UNKNOWN_EXCEPTION` was added in 5.7.5.

- Error: 3037 SQLSTATE: 22023 (`ER_GIS_INVALID_DATA`)

Message: Invalid GIS data provided to function %s.

A spatial function was called with an argument not recognized as a valid geometry value.

`ER_GIS_INVALID_DATA` was added in 5.7.5.

- Error: 3038 SQLSTATE: HY000 (`ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION`)

Message: The geometry has no data in function %s.

`ER_BOOST_GEOMETRY_EMPTY_INPUT_EXCEPTION` was added in 5.7.5.

- Error: 3039 SQLSTATE: HY000 (`ER_BOOST_GEOMETRY_CENTROID_EXCEPTION`)

Message: Unable to calculate centroid because geometry is empty in function %s.

`ER_BOOST_GEOMETRY_CENTROID_EXCEPTION` was added in 5.7.5.

- Error: 3040 SQLSTATE: HY000  
(`ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION`)

Message: Geometry overlay calculation error: geometry data is invalid in function %s.

`ER_BOOST_GEOMETRY_OVERLAY_INVALID_INPUT_EXCEPTION` was added in 5.7.5.

- Error: 3041 SQLSTATE: HY000 (`ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION`)

Message: Geometry turn info calculation error: geometry data is invalid in function %s.

`ER_BOOST_GEOMETRY_TURN_INFO_EXCEPTION` was added in 5.7.5.

- Error: 3042 SQLSTATE: HY000  
(`ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION`)

Message: Analysis procedures of intersection points interrupted unexpectedly in function %s.

`ER_BOOST_GEOMETRY_SELF_INTERSECTION_POINT_EXCEPTION` was added in 5.7.5.

- Error: 3043 SQLSTATE: HY000 ([ER\\_BOOST\\_GEOMETRY\\_UNKNOWN\\_EXCEPTION](#))  
Message: Unknown exception thrown in function %s.  
[ER\\_BOOST\\_GEOMETRY\\_UNKNOWN\\_EXCEPTION](#) was added in 5.7.5.
- Error: 3044 SQLSTATE: HY000 ([ER\\_STD\\_BAD\\_ALLOC\\_ERROR](#))  
Message: Memory allocation error: %s in function %s.  
[ER\\_STD\\_BAD\\_ALLOC\\_ERROR](#) was added in 5.7.5.
- Error: 3045 SQLSTATE: HY000 ([ER\\_STD\\_DOMAIN\\_ERROR](#))  
Message: Domain error: %s in function %s.  
[ER\\_STD\\_DOMAIN\\_ERROR](#) was added in 5.7.5.
- Error: 3046 SQLSTATE: HY000 ([ER\\_STD\\_LENGTH\\_ERROR](#))  
Message: Length error: %s in function %s.  
[ER\\_STD\\_LENGTH\\_ERROR](#) was added in 5.7.5.
- Error: 3047 SQLSTATE: HY000 ([ER\\_STD\\_INVALID\\_ARGUMENT](#))  
Message: Invalid argument error: %s in function %s.  
[ER\\_STD\\_INVALID\\_ARGUMENT](#) was added in 5.7.5.
- Error: 3048 SQLSTATE: HY000 ([ER\\_STD\\_OUT\\_OF\\_RANGE\\_ERROR](#))  
Message: Out of range error: %s in function %s.  
[ER\\_STD\\_OUT\\_OF\\_RANGE\\_ERROR](#) was added in 5.7.5.
- Error: 3049 SQLSTATE: HY000 ([ER\\_STD\\_OVERFLOW\\_ERROR](#))  
Message: Overflow error error: %s in function %s.  
[ER\\_STD\\_OVERFLOW\\_ERROR](#) was added in 5.7.5.
- Error: 3050 SQLSTATE: HY000 ([ER\\_STD\\_RANGE\\_ERROR](#))  
Message: Range error: %s in function %s.  
[ER\\_STD\\_RANGE\\_ERROR](#) was added in 5.7.5.
- Error: 3051 SQLSTATE: HY000 ([ER\\_STD\\_UNDERFLOW\\_ERROR](#))  
Message: Underflow error: %s in function %s.  
[ER\\_STD\\_UNDERFLOW\\_ERROR](#) was added in 5.7.5.
- Error: 3052 SQLSTATE: HY000 ([ER\\_STD\\_LOGIC\\_ERROR](#))  
Message: Logic error: %s in function %s.  
[ER\\_STD\\_LOGIC\\_ERROR](#) was added in 5.7.5.
- Error: 3053 SQLSTATE: HY000 ([ER\\_STD\\_RUNTIME\\_ERROR](#))  
Message: Runtime error: %s in function %s.  
[ER\\_STD\\_RUNTIME\\_ERROR](#) was added in 5.7.5.

- Error: 3054 SQLSTATE: HY000 (ER\_STD\_UNKNOWN\_EXCEPTION)  
Message: Unknown exception: %s in function %s.  
[ER\\_STD\\_UNKNOWN\\_EXCEPTION](#) was added in 5.7.5.
- Error: 3055 SQLSTATE: HY000 (ER\_GIS\_DATA\_WRONG\_ENDIANESS)  
Message: Geometry byte string must be little endian.  
[ER\\_GIS\\_DATA\\_WRONG\\_ENDIANESS](#) was added in 5.7.5.
- Error: 3056 SQLSTATE: HY000 (ER\_CHANGE\_MASTER\_PASSWORD\_LENGTH)  
Message: The password provided for the replication user exceeds the maximum length of 32 characters  
[ER\\_CHANGE\\_MASTER\\_PASSWORD\\_LENGTH](#) was added in 5.7.5.
- Error: 3057 SQLSTATE: 42000 (ER\_USER\_LOCK\_WRONG\_NAME)  
Message: Incorrect user-level lock name '%s'.  
[ER\\_USER\\_LOCK\\_WRONG\\_NAME](#) was added in 5.7.5.
- Error: 3058 SQLSTATE: HY000 (ER\_USER\_LOCK\_DEADLOCK)  
Message: Deadlock found when trying to get user-level lock; try rolling back transaction/releasing locks and restarting lock acquisition.  
  
This error is returned when the metadata locking subsystem detects a deadlock for an attempt to acquire a named lock with [GET\\_LOCK](#).  
[ER\\_USER\\_LOCK\\_DEADLOCK](#) was added in 5.7.5.
- Error: 3059 SQLSTATE: HY000 (ER\_REPLACE\_INACCESSIBLE\_ROWS)  
Message: REPLACE cannot be executed as it requires deleting rows that are not in the view  
[ER\\_REPLACE\\_INACCESSIBLE\\_ROWS](#) was added in 5.7.5.
- Error: 3060 SQLSTATE: HY000 (ER\_ALTER\_OPERATION\_NOT\_SUPPORTED\_REASON\_GIS)  
Message: Do not support online operation on table with GIS index  
[ER\\_ALTER\\_OPERATION\\_NOT\\_SUPPORTED\\_REASON\\_GIS](#) was added in 5.7.5.
- Error: 3061 SQLSTATE: 42000 (ER\_ILLEGAL\_USER\_VAR)  
Message: User variable name '%s' is illegal  
[ER\\_ILLEGAL\\_USER\\_VAR](#) was added in 5.7.5.
- Error: 3062 SQLSTATE: HY000 (ER\_GTID\_MODE\_OFF)  
Message: Cannot %s when GTID\_MODE = OFF.  
[ER\\_GTID\\_MODE\\_OFF](#) was added in 5.7.5.
- Error: 3063 SQLSTATE: HY000 (ER\_UNSUPPORTED\_BY\_REPLICATION\_THREAD)  
Message: Cannot %s from a replication slave thread.  
[ER\\_UNSUPPORTED\\_BY\\_REPLICATION\\_THREAD](#) was added in 5.7.5.

- Error: 3064 SQLSTATE: HY000 (ER\_INCORRECT\_TYPE)  
Message: Incorrect type for argument %s in function %s.  
[ER\\_INCORRECT\\_TYPE](#) was added in 5.7.5.
- Error: 3065 SQLSTATE: HY000 (ER\_FIELD\_IN\_ORDER\_NOT\_SELECT)  
Message: Expression #%u of ORDER BY clause is not in SELECT list, references column '%s' which is not in SELECT list; this is incompatible with %s  
[ER\\_FIELD\\_IN\\_ORDER\\_NOT\\_SELECT](#) was added in 5.7.5.
- Error: 3066 SQLSTATE: HY000 (ER\_AGGREGATE\_IN\_ORDER\_NOT\_SELECT)  
Message: Expression #%u of ORDER BY clause is not in SELECT list, contains aggregate function; this is incompatible with %s  
[ER\\_AGGREGATE\\_IN\\_ORDER\\_NOT\\_SELECT](#) was added in 5.7.5.

[ER\\_INVALID\\_JSON\\_DATA](#) was added in 5.7.5.
- Error: 3070 SQLSTATE: HY000 (ER\_INVALID\_GEOJSON\_MISSING\_MEMBER)  
Message: Invalid GeoJSON data provided to function %s: Missing required member '%s'  
[ER\\_INVALID\\_GEOJSON\\_MISSING\\_MEMBER](#) was added in 5.7.5.
- Error: 3071 SQLSTATE: HY000 (ER\_INVALID\_GEOJSON\_WRONG\_TYPE)  
Message: Invalid GeoJSON data provided to function %s: Member '%s' must be of type '%s'  
[ER\\_INVALID\\_GEOJSON\\_WRONG\\_TYPE](#) was added in 5.7.5.
- Error: 3072 SQLSTATE: HY000 (ER\_INVALID\_GEOJSON\_UNSPECIFIED)  
Message: Invalid GeoJSON data provided to function %s  
[ER\\_INVALID\\_GEOJSON\\_UNSPECIFIED](#) was added in 5.7.5.
- Error: 3073 SQLSTATE: HY000 (ER\_DIMENSION\_UNSUPPORTED)  
Message: Unsupported number of coordinate dimensions in function %s: Found %u, expected %u  
[ER\\_DIMENSION\\_UNSUPPORTED](#) was added in 5.7.5.
- Error: 3074 SQLSTATE: HY000 (ER\_SLAVE\_CHANNEL\_DOES\_NOT\_EXIST)

Message: Slave channel '%s' does not exist.

[ER\\_SLAVE\\_CHANNEL\\_DOES\\_NOT\\_EXIST](#) was added in 5.7.6.

- Error: 3075 SQLSTATE: HY000 ([ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_HOST\\_PORT](#))

Message: A slave channel '%s' already exists for the given host and port combination.

[ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_HOST\\_PORT](#) was added in 5.7.6.

- Error: 3076 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_NAME\\_INVALID\\_OR\\_TOO\\_LONG](#))

Message: Couldn't create channel: Channel name is either invalid or too long.

[ER\\_SLAVE\\_CHANNEL\\_NAME\\_INVALID\\_OR\\_TOO\\_LONG](#) was added in 5.7.6.

- Error: 3077 SQLSTATE: HY000 ([ER\\_SLAVE\\_NEW\\_CHANNEL\\_WRONG\\_REPOSITORY](#))

Message: To have multiple channels, repository cannot be of type FILE; Please check the repository configuration and convert them to TABLE.

[ER\\_SLAVE\\_NEW\\_CHANNEL\\_WRONG\\_REPOSITORY](#) was added in 5.7.6.

- Error: 3078 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_DELETE](#))

Message: Cannot delete slave info objects for channel '%s'.

[ER\\_SLAVE\\_CHANNEL\\_DELETE](#) was added in 5.7.6.

- Error: 3079 SQLSTATE: HY000 ([ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_CMD](#))

Message: Multiple channels exist on the slave. Please provide channel name as an argument.

[ER\\_SLAVE\\_MULTIPLE\\_CHANNELS\\_CMD](#) was added in 5.7.6.

- Error: 3080 SQLSTATE: HY000 ([ER\\_SLAVE\\_MAX\\_CHANNELS\\_EXCEEDED](#))

Message: Maximum number of replication channels allowed exceeded.

[ER\\_SLAVE\\_MAX\\_CHANNELS\\_EXCEEDED](#) was added in 5.7.6.

- Error: 3081 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_MUST\\_STOP](#))

Message: This operation cannot be performed with running replication threads; run STOP SLAVE FOR CHANNEL '%s' first

[ER\\_SLAVE\\_CHANNEL\\_MUST\\_STOP](#) was added in 5.7.6.

- Error: 3082 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_NOT\\_RUNNING](#))

Message: This operation requires running replication threads; configure slave and run START SLAVE FOR CHANNEL '%s'

[ER\\_SLAVE\\_CHANNEL\\_NOT\\_RUNNING](#) was added in 5.7.6.

- Error: 3083 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_WAS\\_RUNNING](#))

Message: Replication thread(s) for channel '%s' are already running.

[ER\\_SLAVE\\_CHANNEL\\_WAS\\_RUNNING](#) was added in 5.7.6.

- Error: 3084 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_WAS\\_NOT\\_RUNNING](#))

Message: Replication thread(s) for channel '%s' are already stopped.

[ER\\_SLAVE\\_CHANNEL\\_WAS\\_NOT\\_RUNNING](#) was added in 5.7.6.

- Error: 3085 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_SQL\\_THREAD\\_MUST\\_STOP](#))

Message: This operation cannot be performed with a running slave sql thread; run STOP SLAVE SQL\_THREAD FOR CHANNEL '%s' first.

[ER\\_SLAVE\\_CHANNEL\\_SQL\\_THREAD\\_MUST\\_STOP](#) was added in 5.7.6.

- Error: 3086 SQLSTATE: HY000 ([ER\\_SLAVE\\_CHANNEL\\_SQL\\_SKIP\\_COUNTER](#))

Message: When sql\_slave\_skip\_counter > 0, it is not allowed to start more than one SQL thread by using 'START SLAVE [SQL\_THREAD]'. Value of sql\_slave\_skip\_counter can only be used by one SQL thread at a time. Please use 'START SLAVE [SQL\_THREAD] FOR CHANNEL' to start the SQL thread which will use the value of sql\_slave\_skip\_counter.

[ER\\_SLAVE\\_CHANNEL\\_SQL\\_SKIP\\_COUNTER](#) was added in 5.7.6.

- Error: 3087 SQLSTATE: HY000 ([ER\\_WRONG\\_FIELD\\_WITH\\_GROUP\\_V2](#))

Message: Expression #%u of %s is not in GROUP BY clause and contains nonaggregated column '%s' which is not functionally dependent on columns in GROUP BY clause; this is incompatible with sql\_mode=only\_full\_group\_by

[ER\\_WRONG\\_FIELD\\_WITH\\_GROUP\\_V2](#) was added in 5.7.6.

- Error: 3088 SQLSTATE: HY000 ([ER\\_MIX\\_OF\\_GROUP\\_FUNC\\_AND\\_FIELDS\\_V2](#))

Message: In aggregated query without GROUP BY, expression #%u of %s contains nonaggregated column '%s'; this is incompatible with sql\_mode=only\_full\_group\_by

[ER\\_MIX\\_OF\\_GROUP\\_FUNC\\_AND\\_FIELDS\\_V2](#) was added in 5.7.6.

- Error: 3089 SQLSTATE: HY000 ([ER\\_WARN\\_DEPRECATED\\_SYSVAR\\_UPDATE](#))

Message: Updating '%s' is deprecated. It will be made read-only in a future release.

[ER\\_WARN\\_DEPRECATED\\_SYSVAR\\_UPDATE](#) was added in 5.7.6.

- Error: 3090 SQLSTATE: HY000 ([ER\\_WARN\\_DEPRECATED\\_SQLMODE](#))

Message: Changing sql mode '%s' is deprecated. It will be removed in a future release.

[ER\\_WARN\\_DEPRECATED\\_SQLMODE](#) was added in 5.7.6.

- Error: 3091 SQLSTATE: HY000 ([ER\\_CANNOT\\_LOG\\_PARTIAL\\_DROP\\_DATABASE\\_WITH\\_GTID](#))

Message: DROP DATABASE failed; some tables may have been dropped but the database directory remains. The GTID has not been added to GTID\_EXECUTED and the statement was not written to the binary log. Fix this as follows: (1) remove all files from the database directory %s; (2) SET GTID\_NEXT='%s'; (3) DROP DATABASE '%s'.

[ER\\_CANNOT\\_LOG\\_PARTIAL\\_DROP\\_DATABASE\\_WITH\\_GTID](#) was added in 5.7.6.

- Error: 3092 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_CONFIGURATION](#))

Message: The server is not configured properly to be an active member of the group. Please see more details on error log.

[ER\\_GROUP\\_REPLICATION\\_CONFIGURATION](#) was added in 5.7.6.

- Error: 3093 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_RUNNING](#))  
Message: The START GROUP\_REPLICATION command failed since the group is already running.  
[ER\\_GROUP\\_REPLICATION\\_RUNNING](#) was added in 5.7.6.
- Error: 3094 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_APPLIER\\_INIT\\_ERROR](#))  
Message: The START GROUP\_REPLICATION command failed as the applier module failed to start.  
[ER\\_GROUP\\_REPLICATION\\_APPLIER\\_INIT\\_ERROR](#) was added in 5.7.6.
- Error: 3095 SQLSTATE: HY000 ([ER\\_GROUP\\_REPLICATION\\_STOP\\_APPLIER\\_THREAD\\_TIMEOUT](#))  
Message: The STOP GROUP\_REPLICATION command execution is incomplete: The applier thread got the stop signal while it was busy. The applier thread will stop once the current task is complete.  
[ER\\_GROUP\\_REPLICATION\\_STOP\\_APPLIER\\_THREAD\\_TIMEOUT](#) was added in 5.7.6.
- Error: 3096 SQLSTATE: HY000  
([ER\\_GROUP\\_REPLICATION\\_COMMUNICATION\\_LAYER\\_SESSION\\_ERROR](#))  
Message: The START GROUP\_REPLICATION command failed as there was an error when initializing the group communication layer.  
[ER\\_GROUP\\_REPLICATION\\_COMMUNICATION\\_LAYER\\_SESSION\\_ERROR](#) was added in 5.7.6.
- Error: 3097 SQLSTATE: HY000  
([ER\\_GROUP\\_REPLICATION\\_COMMUNICATION\\_LAYER\\_JOIN\\_ERROR](#))  
Message: The START GROUP\_REPLICATION command failed as there was an error when joining the communication group.  
[ER\\_GROUP\\_REPLICATION\\_COMMUNICATION\\_LAYER\\_JOIN\\_ERROR](#) was added in 5.7.6.
- Error: 3098 SQLSTATE: HY000 ([ER\\_BEFORE\\_DML\\_VALIDATION\\_ERROR](#))  
Message: The table does not comply with the requirements by an external plugin.  
[ER\\_BEFORE\\_DML\\_VALIDATION\\_ERROR](#) was added in 5.7.6.
- Error: 3099 SQLSTATE: HY000 ([ER\\_PREVENTS\\_VARIABLE\\_WITHOUT\\_RBR](#))  
Message: Cannot change the value of variable %s without binary log format as ROW.  
[transaction\\_write\\_set\\_extraction](#) option value is set and [binlog\\_format](#) is not ROW.  
[ER\\_PREVENTS\\_VARIABLE\\_WITHOUT\\_RBR](#) was added in 5.7.6.
- Error: 3100 SQLSTATE: HY000 ([ER\\_RUN\\_HOOK\\_ERROR](#))  
Message: Error on observer while running replication hook '%s'.  
[ER\\_RUN\\_HOOK\\_ERROR](#) was added in 5.7.6.
- Error: 3101 SQLSTATE: HY000 ([ER\\_TRANSACTION\\_ROLLBACK\\_DURING\\_COMMIT](#))  
Message: Plugin instructed the server to rollback the current transaction.  
  
When using Group Replication, this means that a transaction failed the group certification process, due to one or more members detecting a potential conflict, and was thus rolled back. See [Chapter 17, Group Replication](#).  
[ER\\_TRANSACTION\\_ROLLBACK\\_DURING\\_COMMIT](#) was added in 5.7.6.

- Error: 3102 SQLSTATE: HY000 ([ER\\_GENERATED\\_COLUMN\\_FUNCTION\\_IS\\_NOT\\_ALLOWED](#))  
Message: Expression of generated column '%s' contains a disallowed function.  
[ER\\_GENERATED\\_COLUMN\\_FUNCTION\\_IS\\_NOT\\_ALLOWED](#) was added in 5.7.6.
- Error: 3103 SQLSTATE: HY000 ([ER\\_KEY\\_BASED\\_ON\\_GENERATED\\_COLUMN](#))  
Message: Key/Index cannot be defined on a virtual generated column.  
[ER\\_KEY\\_BASED\\_ON\\_GENERATED\\_COLUMN](#) was added in 5.7.6, removed after 5.7.7.
- Error: 3103 SQLSTATE: HY000 ([ER\\_UNSUPPORTED\\_ALTER\\_INPLACE\\_ON\\_VIRTUAL\\_COLUMN](#))  
Message: INPLACE ADD or DROP of virtual columns cannot be combined with other ALTER TABLE actions  
[ER\\_UNSUPPORTED\\_ALTER\\_INPLACE\\_ON\\_VIRTUAL\\_COLUMN](#) was added in 5.7.8.
- Error: 3104 SQLSTATE: HY000 ([ER\\_WRONG\\_FK\\_OPTION\\_FOR\\_GENERATED\\_COLUMN](#))  
Message: Cannot define foreign key with %s clause on a generated column.  
[ER\\_WRONG\\_FK\\_OPTION\\_FOR\\_GENERATED\\_COLUMN](#) was added in 5.7.6.
- Error: 3105 SQLSTATE: HY000 ([ER\\_NON\\_DEFAULT\\_VALUE\\_FOR\\_GENERATED\\_COLUMN](#))  
Message: The value specified for generated column '%s' in table '%s' is not allowed.  
[ER\\_NON\\_DEFAULT\\_VALUE\\_FOR\\_GENERATED\\_COLUMN](#) was added in 5.7.6.
- Error: 3106 SQLSTATE: HY000 ([ER\\_UNSUPPORTED\\_ACTION\\_ON\\_GENERATED\\_COLUMN](#))  
Message: '%s' is not supported for generated columns.  
[ER\\_UNSUPPORTED\\_ACTION\\_ON\\_GENERATED\\_COLUMN](#) was added in 5.7.6.
- Error: 3107 SQLSTATE: HY000 ([ER\\_GENERATED\\_COLUMN\\_NON\\_PRIOR](#))  
Message: Generated column can refer only to generated columns defined prior to it.  
To address this issue, change the table definition to define each generated column later than any generated columns to which it refers.  
[ER\\_GENERATED\\_COLUMN\\_NON\\_PRIOR](#) was added in 5.7.6.
- Error: 3108 SQLSTATE: HY000 ([ER\\_DEPENDENT\\_BY\\_GENERATED\\_COLUMN](#))  
Message: Column '%s' has a generated column dependency.  
You cannot drop or rename a generated column if another column refers to it. You must either drop those columns as well, or redefine them not to refer to the generated column.  
[ER\\_DEPENDENT\\_BY\\_GENERATED\\_COLUMN](#) was added in 5.7.6.
- Error: 3109 SQLSTATE: HY000 ([ER\\_GENERATED\\_COLUMN\\_REF\\_AUTO\\_INC](#))  
Message: Generated column '%s' cannot refer to auto-increment column.  
[ER\\_GENERATED\\_COLUMN\\_REF\\_AUTO\\_INC](#) was added in 5.7.6.
- Error: 3110 SQLSTATE: HY000 ([ER\\_FEATURE\\_NOT\\_AVAILABLE](#))  
Message: The '%s' feature is not available; you need to remove '%s' or use MySQL built with '%s'

`ER_FEATURE_NOT_AVAILABLE` was added in 5.7.6.

- Error: 3111 SQLSTATE: HY000 (`ER_CANT_SET_GTID_MODE`)

Message: SET @@GLOBAL.GTID\_MODE = %s is not allowed because %s.

`ER_CANT_SET_GTID_MODE` was added in 5.7.6.

- Error: 3112 SQLSTATE: HY000 (`ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF`)

Message: The replication receiver thread%s cannot start in AUTO\_POSITION mode: this server uses @@GLOBAL.GTID\_MODE = OFF.

`ER_CANT_USE_AUTO_POSITION_WITH_GTID_MODE_OFF` was added in 5.7.6.

- Error: 3113 SQLSTATE: HY000 (`ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION`)

Message: Cannot replicate anonymous transaction when AUTO\_POSITION = 1, at file %s, position %lld.

`ER_CANT_REPLICATE_ANONYMOUS_WITH_AUTO_POSITION` was added in 5.7.6.

- Error: 3114 SQLSTATE: HY000 (`ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON`)

Message: Cannot replicate anonymous transaction when @@GLOBAL.GTID\_MODE = ON, at file %s, position %lld.

`ER_CANT_REPLICATE_ANONYMOUS_WITH_GTID_MODE_ON` was added in 5.7.6.

- Error: 3115 SQLSTATE: HY000 (`ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF`)

Message: Cannot replicate GTID-transaction when @@GLOBAL.GTID\_MODE = OFF, at file %s, position %lld.

`ER_CANT_REPLICATE_GTID_WITH_GTID_MODE_OFF` was added in 5.7.6.

- Error: 3116 SQLSTATE: HY000  
(`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS`)

Message: Cannot set ENFORCE\_GTID\_CONSISTENCY = ON because there are ongoing transactions that violate GTID consistency.

`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` is renamed to `ER_CANT_ENFORCE_GTID_CONSISTENCY_WITH_ONGOING_GTID_VIOLATING_TX` in MySQL 8.0.

`ER_CANT_SET_ENFORCE_GTID_CONSISTENCY_ON_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was added in 5.7.6.

- Error: 3117 SQLSTATE: HY000  
(`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS`)

Message: There are ongoing transactions that violate GTID consistency.

`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` is renamed to `ER_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TX` in MySQL 8.0.

`ER_SET_ENFORCE_GTID_CONSISTENCY_WARN_WITH_ONGOING_GTID_VIOLATING_TRANSACTIONS` was added in 5.7.6.

- Error: 3118 SQLSTATE: HY000 (`ER_ACCOUNT_HAS_BEEN_LOCKED`)

Message: Access denied for user '%s'@'%s'. Account is locked.

The account was locked with `CREATE USER ... ACCOUNT LOCK` or `ALTER USER ... ACCOUNT LOCK`. An administrator can unlock it with `ALTER USER ... ACCOUNT UNLOCK`.

`ER_ACCOUNT_HAS_BEEN_LOCKED` was added in 5.7.6.

- Error: 3119 SQLSTATE: 42000 (`ER_WRONG_TABLESPACE_NAME`)

Message: Incorrect tablespace name '%s'

`ER_WRONG_TABLESPACE_NAME` was added in 5.7.6.

- Error: 3120 SQLSTATE: HY000 (`ER_TABLESPACE_IS_NOT_EMPTY`)

Message: Tablespace '%s' is not empty.

`ER_TABLESPACE_IS_NOT_EMPTY` was added in 5.7.6.

- Error: 3121 SQLSTATE: HY000 (`ER_WRONG_FILE_NAME`)

Message: Incorrect File Name '%s'.

`ER_WRONG_FILE_NAME` was added in 5.7.6.

- Error: 3122 SQLSTATE: HY000 (`ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION`)

Message: Inconsistent intersection points.

`ER_BOOST_GEOMETRY_INCONSISTENT_TURNS_EXCEPTION` was added in 5.7.7.

- Error: 3123 SQLSTATE: HY000 (`ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR`)

Message: Optimizer hint syntax error

`ER_WARN_OPTIMIZER_HINT_SYNTAX_ERROR` was added in 5.7.7.

- Error: 3124 SQLSTATE: HY000 (`ER_WARN_BAD_MAX_EXECUTION_TIME`)

Message: Unsupported MAX\_EXECUTION\_TIME

`ER_WARN_BAD_MAX_EXECUTION_TIME` was added in 5.7.7.

- Error: 3125 SQLSTATE: HY000 (`ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME`)

Message: MAX\_EXECUTION\_TIME hint is supported by top-level standalone SELECT statements only

The `MAX_EXECUTION_TIME` optimizer hint is supported only for `SELECT` statements.

`ER_WARN_UNSUPPORTED_MAX_EXECUTION_TIME` was added in 5.7.7.

- Error: 3126 SQLSTATE: HY000 (`ER_WARN_CONFLICTING_HINT`)

Message: Hint %s is ignored as conflicting/duplicated

`ER_WARN_CONFLICTING_HINT` was added in 5.7.7.

- Error: 3127 SQLSTATE: HY000 (`ER_WARN_UNKNOWN_QB_NAME`)

Message: Query block name %s is not found for %s hint

`ER_WARN_UNKNOWN_QB_NAME` was added in 5.7.7.

- Error: 3128 SQLSTATE: HY000 (ER\_UNRESOLVED\_HINT\_NAME)  
Message: Unresolved name %s for %s hint  
ER\_UNRESOLVED\_HINT\_NAME was added in 5.7.7.
- Error: 3129 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SQLMODE\_UNSET)  
Message: Unsetting sql mode '%s' is deprecated. It will be made read-only in a future release.  
ER\_WARN\_DEPRECATED\_SQLMODE\_UNSET was added in 5.7.7, removed after 5.7.7.
- Error: 3129 SQLSTATE: HY000 (ER\_WARN\_ON\_MODIFYING\_GTID\_EXECUTED\_TABLE)  
Message: Please do not modify the %s table. This is a mysql internal system table to store GTIDs for committed transactions. Modifying it can lead to an inconsistent GTID state.  
ER\_WARN\_ON\_MODIFYING\_GTID\_EXECUTED\_TABLE was added in 5.7.8.
- Error: 3130 SQLSTATE: HY000 (ER\_PLUGGABLE\_PROTOCOL\_COMMAND\_NOT\_SUPPORTED)  
Message: Command not supported by pluggable protocols  
ER\_PLUGGABLE\_PROTOCOL\_COMMAND\_NOT\_SUPPORTED was added in 5.7.8.
- Error: 3131 SQLSTATE: 42000 (ER\_LOCKING\_SERVICE\_WRONG\_NAME)  
Message: Incorrect locking service lock name '%s'.  
A locking service name was specified as NULL, the empty string, or a string longer than 64 characters. Namespace and lock names must be non-NULL, nonempty, and no more than 64 characters long.  
ER\_LOCKING\_SERVICE\_WRONG\_NAME was added in 5.7.8.
- Error: 3132 SQLSTATE: HY000 (ER\_LOCKING\_SERVICE\_DEADLOCK)  
Message: Deadlock found when trying to get locking service lock; try releasing locks and restarting lock acquisition.  
ER\_LOCKING\_SERVICE\_DEADLOCK was added in 5.7.8.
- Error: 3133 SQLSTATE: HY000 (ER\_LOCKING\_SERVICE\_TIMEOUT)  
Message: Service lock wait timeout exceeded.  
ER\_LOCKING\_SERVICE\_TIMEOUT was added in 5.7.8.
- Error: 3134 SQLSTATE: HY000 (ER\_GIS\_MAX\_POINTS\_IN\_GEOMETRY\_OVERFLOWED)  
Message: Parameter %s exceeds the maximum number of points in a geometry (%lu) in function %s.  
ER\_GIS\_MAX\_POINTS\_IN\_GEOMETRY\_OVERFLOWED was added in 5.7.8.
- Error: 3135 SQLSTATE: HY000 (ER\_SQL\_MODE\_MERGED)  
Message: 'NO\_ZERO\_DATE', 'NO\_ZERO\_IN\_DATE' and 'ERROR\_FOR\_DIVISION\_BY\_ZERO' sql modes should be used with strict mode. They will be merged with strict mode in a future release.  
ER\_SQL\_MODE\_MERGED was added in 5.7.8.
- Error: 3136 SQLSTATE: HY000 (ER\_VTOKEN\_PLUGIN\_TOKEN\_MISMATCH)  
Message: Version token mismatch for %.\*s. Correct value %.\*s

The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list has at least one matching token name that has a value different from what the client requires. See [Section 5.5.5, “Version Tokens”](#).

`ER_VTOKEN_PLUGIN_TOKEN_MISMATCH` was added in 5.7.8.

- Error: 3137 SQLSTATE: HY000 (`ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND`)

Message: Version token %.\*s not found.

The client has set its `version_tokens_session` system variable to the list of tokens it requires the server to match, but the server token list is missing at least one of those tokens. See [Section 5.5.5, “Version Tokens”](#).

`ER_VTOKEN_PLUGIN_TOKEN_NOT_FOUND` was added in 5.7.8.

- Error: 3138 SQLSTATE: HY000 (`ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID`)

Message: Variable %s cannot be changed by a client that owns a GTID. The client owns %s. Ownership is released on COMMIT or ROLLBACK.

`ER_CANT_SET_VARIABLE_WHEN_OWNING_GTID` was added in 5.7.8.

- Error: 3139 SQLSTATE: HY000 (`ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED`)

Message: %s cannot be performed on channel '%s'.

`ER_SLAVE_CHANNEL_OPERATION_NOT_ALLOWED` was added in 5.7.8.

- Error: 3140 SQLSTATE: 22032 (`ER_INVALID_JSON_TEXT`)

Message: Invalid JSON text: "%s" at position %u in value for column '%s'.

`ER_INVALID_JSON_TEXT` was added in 5.7.8.

- Error: 3141 SQLSTATE: 22032 (`ER_INVALID_JSON_TEXT_IN_PARAM`)

Message: Invalid JSON text in argument %u to function %s: "%s" at position %u.%s

`ER_INVALID_JSON_TEXT_IN_PARAM` was added in 5.7.8.

- Error: 3142 SQLSTATE: HY000 (`ER_INVALID_JSON_BINARY_DATA`)

Message: The JSON binary value contains invalid data.

`ER_INVALID_JSON_BINARY_DATA` was added in 5.7.8.

- Error: 3143 SQLSTATE: 42000 (`ER_INVALID_JSON_PATH`)

Message: Invalid JSON path expression. The error is around character position %u.%s

`ER_INVALID_JSON_PATH` was added in 5.7.8.

- Error: 3144 SQLSTATE: 22032 (`ER_INVALID_JSON_CHARSET`)

Message: Cannot create a JSON value from a string with CHARACTER SET '%s'.

`ER_INVALID_JSON_CHARSET` was added in 5.7.8.

- Error: 3145 SQLSTATE: 22032 (`ER_INVALID_JSON_CHARSET_IN_FUNCTION`)

Message: Invalid JSON character data provided to function %s: '%s'; utf8 is required.

`ER_INVALID_JSON_CHARSET_IN_FUNCTION` was added in 5.7.8.

- Error: 3146 SQLSTATE: 22032 (`ER_INVALID_TYPE_FOR_JSON`)

Message: Invalid data type for JSON data in argument %u to function %s; a JSON string or JSON type is required.

`ER_INVALID_TYPE_FOR_JSON` was added in 5.7.8.

- Error: 3147 SQLSTATE: 22032 (`ER_INVALID_CAST_TO_JSON`)

Message: Cannot CAST value to JSON.

`ER_INVALID_CAST_TO_JSON` was added in 5.7.8.

- Error: 3148 SQLSTATE: 42000 (`ER_INVALID_JSON_PATH_CHARSET`)

Message: A path expression must be encoded in the utf8 character set. The path expression '%s' is encoded in character set '%s'.

`ER_INVALID_JSON_PATH_CHARSET` was added in 5.7.8.

- Error: 3149 SQLSTATE: 42000 (`ER_INVALID_JSON_PATH_WILDCARD`)

Message: In this situation, path expressions may not contain the \* and \*\* tokens.

`ER_INVALID_JSON_PATH_WILDCARD` was added in 5.7.8.

- Error: 3150 SQLSTATE: 22032 (`ER_JSON_VALUE_TOO_BIG`)

Message: The JSON value is too big to be stored in a JSON column.

`ER_JSON_VALUE_TOO_BIG` was added in 5.7.8.

- Error: 3151 SQLSTATE: 22032 (`ER_JSON_KEY_TOO_BIG`)

Message: The JSON object contains a key name that is too long.

`ER_JSON_KEY_TOO_BIG` was added in 5.7.8.

- Error: 3152 SQLSTATE: 42000 (`ER_JSON_USED_AS_KEY`)

Message: JSON column '%s' cannot be used in key specification.

`ER_JSON_USED_AS_KEY` was added in 5.7.8.

- Error: 3153 SQLSTATE: 42000 (`ER_JSON_VACUOUS_PATH`)

Message: The path expression '\$' is not allowed in this context.

`ER_JSON_VACUOUS_PATH` was added in 5.7.8.

- Error: 3154 SQLSTATE: 42000 (`ER_JSON_BAD_ONE_OR_ALL_ARG`)

Message: The oneOrAll argument to %s may take these values: 'one' or 'all'.

`ER_JSON_BAD_ONE_OR_ALL_ARG` was added in 5.7.8.

- Error: 3155 SQLSTATE: 22003 (`ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE`)

Message: Out of range JSON value for CAST to %s%s from column %s at row %ld

`ER_NUMERIC_JSON_VALUE_OUT_OF_RANGE` was added in 5.7.8.

- Error: 3156 SQLSTATE: 22018 ([ER\\_INVALID\\_JSON\\_VALUE\\_FOR\\_CAST](#))  
Message: Invalid JSON value for CAST to %s%s from column %s at row %ld  
[ER\\_INVALID\\_JSON\\_VALUE\\_FOR\\_CAST](#) was added in 5.7.8.
- Error: 3157 SQLSTATE: 22032 ([ER\\_JSON\\_DOCUMENT\\_TOO\\_DEEP](#))  
Message: The JSON document exceeds the maximum depth.  
[ER\\_JSON\\_DOCUMENT\\_TOO\\_DEEP](#) was added in 5.7.8.
- Error: 3158 SQLSTATE: 22032 ([ER\\_JSON\\_DOCUMENT\\_NULL\\_KEY](#))  
Message: JSON documents may not contain NULL member names.  
[ER\\_JSON\\_DOCUMENT\\_NULL\\_KEY](#) was added in 5.7.8.
- Error: 3159 SQLSTATE: HY000 ([ER\\_SECURE\\_TRANSPORT\\_REQUIRED](#))  
Message: Connections using insecure transport are prohibited while --require\_secure\_transport=ON.  
With the [require\\_secure\\_transport](#) system variable, clients can connect only using secure transports. Qualifying connections are those using SSL, a Unix socket file, or shared memory.  
[ER\\_SECURE\\_TRANSPORT\\_REQUIRED](#) was added in 5.7.8.
- Error: 3160 SQLSTATE: HY000 ([ER\\_NO\\_SECURE\\_TRANSPORTS\\_CONFIGURED](#))  
Message: No secure transports (SSL or Shared Memory) are configured, unable to set --require\_secure\_transport=ON.  
The [require\\_secure\\_transport](#) system variable cannot be enabled if the server does not support at least one secure transport. Configure the server with the required SSL keys/certificates to enable SSL connections, or enable the [shared\\_memory](#) system variable to enable shared-memory connections.  
[ER\\_NO\\_SECURE\\_TRANSPORTS\\_CONFIGURED](#) was added in 5.7.8.
- Error: 3161 SQLSTATE: HY000 ([ER\\_DISABLED\\_STORAGE\\_ENGINE](#))  
Message: Storage engine %s is disabled (Table creation is disallowed).  
An attempt was made to create a table or tablespace using a storage engine listed in the value of the [disabled\\_storage\\_engines](#) system variable, or to change an existing table or tablespace to such an engine. Choose a different storage engine.  
[ER\\_DISABLED\\_STORAGE\\_ENGINE](#) was added in 5.7.8.
- Error: 3162 SQLSTATE: HY000 ([ER\\_USER\\_DOES\\_NOT\\_EXIST](#))  
Message: User %s does not exist.  
[ER\\_USER\\_DOES\\_NOT\\_EXIST](#) was added in 5.7.8.
- Error: 3163 SQLSTATE: HY000 ([ER\\_USER\\_ALREADY\\_EXISTS](#))  
Message: User %s already exists.  
[ER\\_USER\\_ALREADY\\_EXISTS](#) was added in 5.7.8.
- Error: 3164 SQLSTATE: HY000 ([ER\\_AUDIT\\_API\\_ABORT](#))  
Message: Aborted by Audit API ('%s';%d).

This error indicates that an audit plugin terminated execution of an event. The message typically indicates the event subclass name and a numeric status value.

[ER\\_AUDIT\\_API\\_ABORT](#) was added in 5.7.8.

- Error: 3165 SQLSTATE: 42000 ([ER\\_INVALID\\_JSON\\_PATH\\_ARRAY\\_CELL](#))

Message: A path expression is not a path to a cell in an array.

[ER\\_INVALID\\_JSON\\_PATH\\_ARRAY\\_CELL](#) was added in 5.7.8.

- Error: 3166 SQLSTATE: HY000 ([ER\\_BUFPOOL\\_RESIZE\\_INPROGRESS](#))

Message: Another buffer pool resize is already in progress.

[ER\\_BUFPOOL\\_RESIZE\\_INPROGRESS](#) was added in 5.7.9.

- Error: 3167 SQLSTATE: HY000 ([ER\\_FEATURE\\_DISABLED\\_SEE\\_DOC](#))

Message: The '%s' feature is disabled; see the documentation for '%s'

[ER\\_FEATURE\\_DISABLED\\_SEE\\_DOC](#) was added in 5.7.9.

- Error: 3168 SQLSTATE: HY000 ([ER\\_SERVER\\_ISNT\\_AVAILABLE](#))

Message: Server isn't available

[ER\\_SERVER\\_ISNT\\_AVAILABLE](#) was added in 5.7.9.

- Error: 3169 SQLSTATE: HY000 ([ER\\_SESSION\\_WAS\\_KILLED](#))

Message: Session was killed

[ER\\_SESSION\\_WAS\\_KILLED](#) was added in 5.7.9.

- Error: 3170 SQLSTATE: HY000 ([ER\\_CAPACITY\\_EXCEEDED](#))

Message: Memory capacity of %llu bytes for '%s' exceeded. %s

[ER\\_CAPACITY\\_EXCEEDED](#) was added in 5.7.9.

- Error: 3171 SQLSTATE: HY000 ([ER\\_CAPACITY\\_EXCEEDED\\_IN\\_RANGE\\_OPTIMIZER](#))

Message: Range optimization was not done for this query.

[ER\\_CAPACITY\\_EXCEEDED\\_IN\\_RANGE\\_OPTIMIZER](#) was added in 5.7.9.

- Error: 3172 SQLSTATE: HY000 ([ER\\_TABLE\\_NEEDS\\_UPG\\_PART](#))

Message: Partitioning upgrade required. Please dump/reload to fix it or do: ALTER TABLE '%s'.'%s' UPGRADE PARTITIONING

[ER\\_TABLE\\_NEEDS\\_UPG\\_PART](#) was added in 5.7.9.

- Error: 3173 SQLSTATE: HY000  
([ER\\_CANT\\_WAIT\\_FOR\\_EXECUTED\\_GTID\\_SET\\_WHILE\\_OWNING\\_A\\_GTID](#))

Message: The client holds ownership of the GTID %s. Therefore, WAIT\_FOR\_EXECUTED\_GTID\_SET cannot wait for this GTID.

[ER\\_CANT\\_WAIT\\_FOR\\_EXECUTED\\_GTID\\_SET\\_WHILE\\_OWNING\\_A\\_GTID](#) was added in 5.7.9.

- Error: 3174 SQLSTATE: HY000 ([ER\\_CANNOT\\_ADD\\_FOREIGN\\_BASE\\_COL\\_VIRTUAL](#))

Message: Cannot add foreign key on the base column of indexed virtual column.

[ER\\_CANNOT\\_ADD\\_FOREIGN\\_BASE\\_COL\\_VIRTUAL](#) was added in 5.7.10.

- Error: 3175 SQLSTATE: HY000 ([ER\\_CANNOT\\_CREATE\\_VIRTUAL\\_INDEX\\_CONSTRAINT](#))

Message: Cannot create index on virtual column whose base column has foreign constraint.

[ER\\_CANNOT\\_CREATE\\_VIRTUAL\\_INDEX\\_CONSTRAINT](#) was added in 5.7.10.

- Error: 3176 SQLSTATE: HY000 ([ER\\_ERROR\\_ON\\_MODIFYING\\_GTID\\_EXECUTED\\_TABLE](#))

Message: Please do not modify the %s table with an XA transaction. This is an internal system table used to store GTIDs for committed transactions. Although modifying it can lead to an inconsistent GTID state, if necessary you can modify it with a non-XA transaction.

[ER\\_ERROR\\_ON\\_MODIFYING\\_GTID\\_EXECUTED\\_TABLE](#) was added in 5.7.11.

- Error: 3177 SQLSTATE: HY000 ([ER\\_LOCK\\_REFUSED\\_BY\\_ENGINE](#))

Message: Lock acquisition refused by storage engine.

[ER\\_LOCK\\_REFUSED\\_BY\\_ENGINE](#) was added in 5.7.11.

- Error: 3178 SQLSTATE: HY000 ([ER\\_UNSUPPORTED\\_ALTER\\_ONLINE\\_ON\\_VIRTUAL\\_COLUMN](#))

Message: ADD COLUMN col...VIRTUAL, ADD INDEX(col)

[ER\\_UNSUPPORTED\\_ALTER\\_ONLINE\\_ON\\_VIRTUAL\\_COLUMN](#) was added in 5.7.11.

- Error: 3179 SQLSTATE: HY000 ([ER\\_MASTER\\_KEY\\_ROTATION\\_NOT\\_SUPPORTED\\_BY\\_SE](#))

Message: Master key rotation is not supported by storage engine.

[ER\\_MASTER\\_KEY\\_ROTATION\\_NOT\\_SUPPORTED\\_BY\\_SE](#) was added in 5.7.11.

- Error: 3180 SQLSTATE: HY000 ([ER\\_MASTER\\_KEY\\_ROTATION\\_ERROR\\_BY\\_SE](#))

Message: Encryption key rotation error reported by SE: %s

[ER\\_MASTER\\_KEY\\_ROTATION\\_ERROR\\_BY\\_SE](#) was added in 5.7.11.

- Error: 3181 SQLSTATE: HY000 ([ER\\_MASTER\\_KEY\\_ROTATION\\_BINLOG\\_FAILED](#))

Message: Write to binlog failed. However, master key rotation has been completed successfully.

[ER\\_MASTER\\_KEY\\_ROTATION\\_BINLOG\\_FAILED](#) was added in 5.7.11.

- Error: 3182 SQLSTATE: HY000 ([ER\\_MASTER\\_KEY\\_ROTATION\\_SE\\_UNAVAILABLE](#))

Message: Storage engine is not available.

[ER\\_MASTER\\_KEY\\_ROTATION\\_SE\\_UNAVAILABLE](#) was added in 5.7.11.

- Error: 3183 SQLSTATE: HY000 ([ER\\_TABLESPACE\\_CANNOT\\_ENCRYPT](#))

Message: This tablespace can't be encrypted.

[ER\\_TABLESPACE\\_CANNOT\\_ENCRYPT](#) was added in 5.7.11.

- Error: 3184 SQLSTATE: HY000 ([ER\\_INVALID\\_ENCRYPTION\\_OPTION](#))

Message: Invalid encryption option.

`ER_INVALID_ENCRYPTION_OPTION` was added in 5.7.11.

- Error: 3185 SQLSTATE: HY000 (`ER_CANNOT_FIND_KEY_IN_KEYRING`)

Message: Can't find master key from keyring, please check in the server log if a keyring plugin is loaded and initialized successfully.

`ER_CANNOT_FIND_KEY_IN_KEYRING` was added in 5.7.11.

- Error: 3186 SQLSTATE: HY000 (`ER_CAPACITY_EXCEEDED_IN_PARSER`)

Message: Parser bailed out for this query.

`ER_CAPACITY_EXCEEDED_IN_PARSER` was added in 5.7.12.

- Error: 3187 SQLSTATE: HY000 (`ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE`)

Message: Cannot alter encryption attribute by inplace algorithm.

`ER_UNSUPPORTED_ALTER_ENCRYPTION_INPLACE` was added in 5.7.13.

- Error: 3188 SQLSTATE: HY000 (`ER_KEYRING_UDF_KEYRING_SERVICE_ERROR`)

Message: Function '%s' failed because underlying keyring service returned an error. Please check if a keyring plugin is installed and that provided arguments are valid for the keyring you are using.

`ER_KEYRING_UDF_KEYRING_SERVICE_ERROR` was added in 5.7.13.

- Error: 3189 SQLSTATE: HY000 (`ER_USER_COLUMN_OLD_LENGTH`)

Message: It seems that your db schema is old. The %s column is 77 characters long and should be 93 characters long. Please run `mysql_upgrade`.

`ER_USER_COLUMN_OLD_LENGTH` was added in 5.7.13.

- Error: 3190 SQLSTATE: HY000 (`ER_CANT_RESET_MASTER`)

Message: RESET MASTER is not allowed because %s.

`ER_CANT_RESET_MASTER` was added in 5.7.14.

- Error: 3191 SQLSTATE: HY000 (`ER_GROUP_REPLICATION_MAX_GROUP_SIZE`)

Message: The START GROUP\_REPLICATION command failed since the group already has 9 members.

`ER_GROUP_REPLICATION_MAX_GROUP_SIZE` was added in 5.7.14.

- Error: 3192 SQLSTATE: HY000 (`ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED`)

Message: Cannot add foreign key on the base column of stored column.

`ER_CANNOT_ADD_FOREIGN_BASE_COL_STORED` was added in 5.7.14.

- Error: 3193 SQLSTATE: HY000 (`ER_TABLE_REFERENCED`)

Message: Cannot complete the operation because table is referenced by another connection.

`ER_TABLE_REFERENCED` was added in 5.7.14.

- Error: 3194 SQLSTATE: HY000 (`ER_PARTITION_ENGINE_DEPRECATED_FOR_TABLE`)

Message: The partition engine, used by table '%s.%s', is deprecated and will be removed in a future release. Please use native partitioning instead.

[ER\\_PARTITION\\_ENGINE\\_DEPRECATED\\_FOR\\_TABLE](#) was added in 5.7.17.

- Error: [3195](#) SQLSTATE: [01000](#) ([ER\\_WARN\\_USING\\_GEOMFROMWKB\\_TO\\_SET\\_SRID\\_ZERO](#))

Message: %s(geometry) is deprecated and will be replaced by st\_srid(geometry, 0) in a future version. Use %s(st\_aswkb(geometry), 0) instead.

[ER\\_WARN\\_USING\\_GEOMFROMWKB\\_TO\\_SET\\_SRID\\_ZERO](#) was added in 5.7.19.

- Error: [3196](#) SQLSTATE: [01000](#) ([ER\\_WARN\\_USING\\_GEOMFROMWKB\\_TO\\_SET\\_SRID](#))

Message: %s(geometry, srid) is deprecated and will be replaced by st\_srid(geometry, srid) in a future version. Use %s(st\_aswkb(geometry), srid) instead.

[ER\\_WARN\\_USING\\_GEOMFROMWKB\\_TO\\_SET\\_SRID](#) was added in 5.7.19.

- Error: [3197](#) SQLSTATE: [HY000](#) ([ER\\_XA\\_RETRY](#))

Message: The resource manager is not able to commit the transaction branch at this time. Please retry later.

[ER\\_XA\\_RETRY](#) was added in 5.7.19.

- Error: [3198](#) SQLSTATE: [HY000](#) ([ER\\_KEYRING\\_AWS\\_UDF\\_AWS\\_KMS\\_ERROR](#))

Message: Function %s failed due to: %s.

[ER\\_KEYRING\\_AWS\\_UDF\\_AWS\\_KMS\\_ERROR](#) was added in 5.7.19.

- Error: [3199](#) SQLSTATE: [HY000](#) ([ER\\_BINLOG\\_UNSAFE\\_XA](#))

Message: Statement is unsafe because it is being used inside a XA transaction. Concurrent XA transactions may deadlock on slaves when replicated using statements.

[ER\\_BINLOG\\_UNSAFE\\_XA](#) was added in 5.7.20.

- Error: [3200](#) SQLSTATE: [HY000](#) ([ER\\_UDF\\_ERROR](#))

Message: %s UDF failed; %s

[ER\\_UDF\\_ERROR](#) was added in 5.7.21.

- Error: [3201](#) SQLSTATE: [HY000](#) ([ER\\_KEYRING\\_MIGRATION\\_FAILURE](#))

Message: Can not perform keyring migration : %s

[ER\\_KEYRING\\_MIGRATION\\_FAILURE](#) was added in 5.7.21.

- Error: [3202](#) SQLSTATE: [42000](#) ([ER\\_KEYRING\\_ACCESS\\_DENIED\\_ERROR](#))

Message: Access denied; you need %s privileges for this operation

[ER\\_KEYRING\\_ACCESS\\_DENIED\\_ERROR](#) was added in 5.7.21.

- Error: [3203](#) SQLSTATE: [HY000](#) ([ER\\_KEYRING\\_MIGRATION\\_STATUS](#))

Message: Keyring migration %s.

[ER\\_KEYRING\\_MIGRATION\\_STATUS](#) was added in 5.7.21.

- Error: 3204 SQLSTATE: HY000 (ER\_PLUGIN\_FAILED\_TO\_OPEN\_TABLES)  
Message: Failed to open the %s filter tables.  
[ER\\_PLUGIN\\_FAILED\\_TO\\_OPEN\\_TABLES](#) was added in 5.7.22.
- Error: 3205 SQLSTATE: HY000 (ER\_PLUGIN\_FAILED\_TO\_OPEN\_TABLE)  
Message: Failed to open '%s.%s' %s table.  
[ER\\_PLUGIN\\_FAILED\\_TO\\_OPEN\\_TABLE](#) was added in 5.7.22.
- Error: 3206 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_NO\_KEYRING\_PLUGIN\_INSTALLED)  
Message: No keyring plugin installed.  
[ER\\_AUDIT\\_LOG\\_NO\\_KEYRING\\_PLUGIN\\_INSTALLED](#) was added in 5.7.22.
- Error: 3207 SQLSTATE: HY000  
(ER\_AUDIT\_LOG\_ENCRYPTION\_PASSWORD\_HAS\_NOT\_BEEN\_SET)  
Message: Audit log encryption password has not been set; it will be generated automatically. Use `audit_log_encryption_password_get` to obtain the password or `audit_log_encryption_password_set` to set a new one.  
[ER\\_AUDIT\\_LOG\\_ENCRYPTION\\_PASSWORD\\_HAS\\_NOT\\_BEEN\\_SET](#) was added in 5.7.22.
- Error: 3208 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_COULD\_NOT\_CREATE\_AES\_KEY)  
Message: Could not create AES key. OpenSSL's EVP\_BytesToKey function failed.  
[ER\\_AUDIT\\_LOG\\_COULD\\_NOT\\_CREATE\\_AES\\_KEY](#) was added in 5.7.22.
- Error: 3209 SQLSTATE: HY000  
(ER\_AUDIT\_LOG\_ENCRYPTION\_PASSWORD\_CANNOT\_BE\_FETCHED)  
Message: Audit log encryption password cannot be fetched from the keyring. Password used so far is used for encryption.  
[ER\\_AUDIT\\_LOG\\_ENCRYPTION\\_PASSWORD\\_CANNOT\\_BE\\_FETCHED](#) was added in 5.7.22.
- Error: 3210 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_JSON\_FILTERING\_NOT\_ENABLED)  
Message: Audit Log filtering has not been installed.  
[ER\\_AUDIT\\_LOG\\_JSON\\_FILTERING\\_NOT\\_ENABLED](#) was added in 5.7.22.
- Error: 3211 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_UDF\_INSUFFICIENT\_PRIVILEGE)  
Message: Request ignored for '%s'@'%s'. SUPER\_ACL needed to perform operation  
[ER\\_AUDIT\\_LOG\\_UDF\\_INSUFFICIENT\\_PRIVILEGE](#) was added in 5.7.22.

Message: Invalid "max\_array\_length" argument value.  
[ER\\_AUDIT\\_LOG\\_UDF\\_READ\\_INVALID\\_MAX\\_ARRAY\\_LENGTH\\_ARG\\_VALUE](#) was added in 5.7.22.
- Error: 3219 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_JSON\_FILTER\_PARSING\_ERROR)  
Message: %s  
[ER\\_AUDIT\\_LOG\\_JSON\\_FILTER\\_PARSING\\_ERROR](#) was added in 5.7.22.
- Error: 3220 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_JSON\_FILTER\_NAME\_CANNOT\_BE\_EMPTY)  
Message: Filter name cannot be empty.  
[ER\\_AUDIT\\_LOG\\_JSON\\_FILTER\\_NAME\\_CANNOT\\_BE\\_EMPTY](#) was added in 5.7.22.
- Error: 3221 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_JSON\_USER\_NAME\_CANNOT\_BE\_EMPTY)  
Message: User cannot be empty.  
[ER\\_AUDIT\\_LOG\\_JSON\\_USER\\_NAME\\_CANNOT\\_BE\\_EMPTY](#) was added in 5.7.22.
- Error: 3222 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_JSON\_FILTER\_DOES\_NOT\_EXISTS)  
Message: Specified filter has not been found.  
[ER\\_AUDIT\\_LOG\\_JSON\\_FILTER\\_DOES\\_NOT\\_EXISTS](#) was added in 5.7.22.
- Error: 3223 SQLSTATE: HY000  
(ER\_AUDIT\_LOG\_USER\_FIRST\_CHARACTER\_MUST\_BE\_ALPHANUMERIC)  
Message: First character of the user name must be alphanumeric.  
[ER\\_AUDIT\\_LOG\\_USER\\_FIRST\\_CHARACTER\\_MUST\\_BE\\_ALPHANUMERIC](#) was added in 5.7.22.
- Error: 3224 SQLSTATE: HY000 (ER\_AUDIT\_LOG\_USER\_NAME\_INVALID\_CHARACTER)

Message: Invalid character in the user name.

[ER\\_AUDIT\\_LOG\\_USER\\_NAME\\_INVALID\\_CHARACTER](#) was added in 5.7.22.

- Error: [3225](#) SQLSTATE: [HY000](#) ([ER\\_AUDIT\\_LOG\\_HOST\\_NAME\\_INVALID\\_CHARACTER](#))

Message: Invalid character in the host name.

[ER\\_AUDIT\\_LOG\\_HOST\\_NAME\\_INVALID\\_CHARACTER](#) was added in 5.7.22.

- Error: [3226](#) SQLSTATE: [HY000](#) ([WARN\\_DEPRECATED\\_MAXDB\\_SQL\\_MODE\\_FOR\\_TIMESTAMP](#))

Message: With the MAXDB SQL mode enabled, `TIMESTAMP` is identical with `DATETIME`. The MAXDB SQL mode is deprecated and will be removed in a future release. Please disable the MAXDB SQL mode and use `DATETIME` instead.

[WARN\\_DEPRECATED\\_MAXDB\\_SQL\\_MODE\\_FOR\\_TIMESTAMP](#) was added in 5.7.22.

- Error: [3227](#) SQLSTATE: [HY000](#) ([ER\\_XA\\_REPLICATION\\_FILTERS](#))

Message: The use of replication filters with XA transactions is not supported, and can lead to an undefined state in the replication slave.

[ER\\_XA\\_REPLICATION\\_FILTERS](#) was added in 5.7.23.

- Error: [3228](#) SQLSTATE: [HY000](#) ([ER\\_CANT\\_OPEN\\_ERROR\\_LOG](#))

Message: Could not open file '%s' for error logging%s%s

[ER\\_CANT\\_OPEN\\_ERROR\\_LOG](#) was added in 5.7.24.

## B.4 Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errmsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000](#) ([CR\\_UNKNOWN\\_ERROR](#))

Message: Unknown MySQL error

- Error: [2001](#) ([CR\\_SOCKET\\_CREATE\\_ERROR](#))

Message: Can't create UNIX socket (%d)

- Error: [2002](#) ([CR\\_CONNECTION\\_ERROR](#))

Message: Can't connect to local MySQL server through socket '%s' (%d)

- Error: [2003](#) ([CR\\_CONN\\_HOST\\_ERROR](#))

Message: Can't connect to MySQL server on '%s' (%d)

- Error: [2004](#) ([CR\\_IPSOCK\\_ERROR](#))

Message: Can't create TCP/IP socket (%d)

- Error: 2005 (CR\_UNKNOWN\_HOST)

Message: Unknown MySQL server host '%s' (%d)

- Error: 2006 (CR\_SERVER\_GONE\_ERROR)

Message: MySQL server has gone away

- Error: 2007 (CR\_VERSION\_ERROR)

Message: Protocol mismatch; server version = %d, client version = %d

- Error: 2008 (CR\_OUT\_OF\_MEMORY)

Message: MySQL client ran out of memory

- Error: 2009 (CR\_WRONG\_HOST\_INFO)

Message: Wrong host info

- Error: 2010 (CR\_LOCALHOST\_CONNECTION)

Message: Localhost via UNIX socket

- Error: 2011 (CR\_TCP\_CONNECTION)

Message: %s via TCP/IP

- Error: 2012 (CR\_SERVER\_HANDSHAKE\_ERR)

Message: Error in server handshake

- Error: 2013 (CR\_SERVER\_LOST)

Message: Lost connection to MySQL server during query

- Error: 2014 (CR\_COMMANDS\_OUT\_OF\_SYNC)

Message: Commands out of sync; you can't run this command now

- Error: 2015 (CR\_NAMEDPIPE\_CONNECTION)

Message: Named pipe: %s

- Error: 2016 (CR\_NAMEDPIPEWAIT\_ERROR)

Message: Can't wait for named pipe to host: %s pipe: %s (%lu)

- Error: 2017 (CR\_NAMEDPIPEOPEN\_ERROR)

Message: Can't open named pipe to host: %s pipe: %s (%lu)

- Error: 2018 (CR\_NAMEDPIPESETSTATE\_ERROR)

Message: Can't set state of named pipe to host: %s pipe: %s (%lu)

- Error: 2019 (CR\_CANT\_READ\_CHARSET)

Message: Can't initialize character set %s (path: %s)

- Error: 2020 (CR\_NET\_PACKET\_TOO\_LARGE)

Message: Got packet bigger than 'max\_allowed\_packet' bytes

- Error: 2021 ([CR\\_EMBEDDED\\_CONNECTION](#))

Message: Embedded server

- Error: 2022 ([CR\\_PROBE\\_SLAVE\\_STATUS](#))

Message: Error on SHOW SLAVE STATUS:

- Error: 2023 ([CR\\_PROBE\\_SLAVE\\_HOSTS](#))

Message: Error on SHOW SLAVE HOSTS:

- Error: 2024 ([CR\\_PROBE\\_SLAVE\\_CONNECT](#))

Message: Error connecting to slave:

- Error: 2025 ([CR\\_PROBE\\_MASTER\\_CONNECT](#))

Message: Error connecting to master:

- Error: 2026 ([CR\\_SSL\\_CONNECTION\\_ERROR](#))

Message: SSL connection error: %s

- Error: 2027 ([CR\\_MALFORMED\\_PACKET](#))

Message: Malformed packet

- Error: 2028 ([CR\\_WRONG\\_LICENSE](#))

Message: This client library is licensed only for use with MySQL servers having '%s' license

- Error: 2029 ([CR\\_NULL\\_POINTER](#))

Message: Invalid use of null pointer

- Error: 2030 ([CR\\_NO\\_PREPARE\\_STMT](#))

Message: Statement not prepared

- Error: 2031 ([CR\\_PARAMS\\_NOT\\_BOUND](#))

Message: No data supplied for parameters in prepared statement

- Error: 2032 ([CR\\_DATA\\_TRUNCATED](#))

Message: Data truncated

- Error: 2033 ([CR\\_NO\\_PARAMETERS\\_EXISTS](#))

Message: No parameters exist in the statement

- Error: 2034 ([CR\\_INVALID\\_PARAMETER\\_NO](#))

Message: Invalid parameter number

The column number for [mysql\\_stmt\\_fetch\\_column\(\)](#) was invalid.

The parameter number for [mysql\\_stmt\\_send\\_long\\_data\(\)](#) was invalid.

A key name was empty or the amount of connection attribute data for [mysql\\_options4\(\)](#) exceeds the 64KB limit.

- Error: [2035 \(CR\\_INVALID\\_BUFFER\\_USE\)](#)  
Message: Can't send long data for non-string/non-binary data types (parameter: %d)
- Error: [2036 \(CR\\_UNSUPPORTED\\_PARAM\\_TYPE\)](#)  
Message: Using unsupported buffer type: %d (parameter: %d)

Message: Authentication plugin '%s' reported error: %s

[CR\\_AUTH\\_PLUGIN\\_ERR](#) was added in 5.7.1.

- Error: [2062 \(CR\\_INSECURE\\_API\\_ERR\)](#)

Message: Insecure API function call: '%s' Use instead: '%s'

An insecure function call was detected. Modify the application to use the suggested alternative function instead.

`CR_INSECURE_API_ERR` was added in 5.7.6.

## B.5 Problems and Common Errors

This section lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

### B.5.1 How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard does not work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light does not change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer does not move.
  - The machine does not answer to a remote machine's pings.
  - Other programs that are not related to MySQL do not behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as `glibc`) are up to date.

It is always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.4, “MySQL Server Logs”](#).
- If you do not think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it does not want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it is time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system does not work.” This provides us with no information about what could be the problem.

If a program fails, it is always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.7, “How to Report Bugs or Problems”](#).

## B.5.2 Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### B.5.2.1 Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server permits client programs to use when connecting. See [Section 6.2, “The MySQL Access Privilege System”](#), and [Section 6.2.7, “Troubleshooting Problems Connecting to MySQL”](#).

### B.5.2.2 Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the file system (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you do not specify a host name or if you specify the special host name `localhost`.

If the MySQL server is running on Windows, you can connect using TCP/IP. If the server is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you do not give a host name when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that does not work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the host name.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket file name or TCP/IP port number when trying to connect to the server. You should also check that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, and that the network port you specified is the one configured on the server.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2, “Starting the Server”](#).

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket file name might be different in your setup. `host_ip` represents the IP address of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=SOCKET --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotation marks with the `hostname` command; these cause the output of `hostname` (that is, the current host name) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the host name of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Make sure that the server has not been configured to ignore network connections or (if you are attempting to connect remotely) that it has not been configured to listen only locally on its network interfaces. If the server was started with `--skip-networking`, it will not accept TCP/IP connections at all. If the server was started with `--bind-address=127.0.0.1`, it will listen for TCP/IP connections only locally on the loopback interface and will not accept remote connections.

Check to make sure that there is no firewall blocking access to MySQL. Your firewall may be configured on the basis of the application being executed, or the port number used by MySQL for communication (3306 by default). Under Linux or Unix, check your IP tables (or similar) configuration to ensure that the port has not been blocked. Under Windows, applications such as ZoneAlarm or Windows Firewall may need to be configured not to block the MySQL port.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running on the local host. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Connection to MySQL Server Failing on Windows](#).
- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section B.5.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket path name for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section B.5.3.6, "How to Protect or Change the MySQL Unix Socket File"](#).

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill`) before you can restart the MySQL server. See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges

for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket file name in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- If you are running under Linux and Security-Enhanced Linux (SELinux) is enabled, make sure you have disabled SELinux protection for the `mysqld` process.

## Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows does not allow for enough ephemeral (short-lived) ports to serve those connections.

The purpose of `TIME_WAIT` is to keep a connection accepting packets even after the connection has been closed. This is because Internet routing can cause a packet to take a slow route to its destination and it may arrive after both sides have agreed to close. If the port is in use for a new connection, that packet from the old connection could break the protocol or compromise personal information from the original connection. The `TIME_WAIT` delay prevents this by ensuring that the port cannot be reused until after some time has been permitted for those delayed packets to arrive.

It is safe to reduce `TIME_WAIT` greatly on LAN connections because there is little chance of packets arriving at very long delays, as they could through the Internet with its comparatively large distances and latencies.

Windows permits ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. The port will not be available again until this time expires. The default range of port numbers depends on the version of Windows, with a more limited number of ports in older versions:

- Windows through Server 2003: Ports in range 1025–5000
- Windows Vista, Server 2008, and newer: Ports in range 49152–65535

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

### Important

The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you

understand how to restore it if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the [Edit](#) menu, click [Add Value](#), and then add the following registry value:

```
Value Name: MaxUserPort  
Data Type: REG_DWORD  
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the [Edit](#) menu, click [Add Value](#), and then add the following registry value:

```
Value Name: TcpTimedWaitDelay  
Data Type: REG_DWORD  
Value: 30
```

This sets the number of seconds to hold a TCP port connection in [TIME\\_WAIT](#) state before closing. The valid range is between 30 and 300 decimal, although you may wish to check with Microsoft for the latest permitted values. The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### B.5.2.3 Lost connection to MySQL server

There are three likely causes for this error message.

Usually it indicates network connectivity trouble and you should check the condition of your network if this error occurs frequently. If the error message includes “during query,” this is probably the case you are experiencing.

Sometimes the “during query” form happens when millions of rows are being sent as part of one or more queries. If you know that this is happening, you should try increasing [net\\_read\\_timeout](#) from its default of 30 seconds to 60 seconds or longer, sufficient for the data transfer to complete.

More rarely, it can happen when the client is attempting the initial connection to the server. In this case, if your [connect\\_timeout](#) value is set to only a few seconds, you may be able to resolve the problem by increasing it to ten seconds, perhaps more if you have a very long distance or slow connection. You can determine whether you are experiencing this more uncommon cause by using [SHOW GLOBAL STATUS LIKE 'Aborted\\_connects'](#). It will increase by one for each initial connection attempt that the server aborts. You may see “reading authorization packet” as part of the error message; if so, that also suggests that this is the solution that you need.

If the cause is none of those just described, you may be experiencing a problem with [BLOB](#) values that are larger than [max\\_allowed\\_packet](#), which can cause this error with some clients. Sometime you may see an [ER\\_NET\\_PACKET\\_TOO\\_LARGE](#) error, and that confirms that you need to increase [max\\_allowed\\_packet](#).

### B.5.2.4 Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

### B.5.2.5 Host 'host\_name' is blocked

If the following error occurs, it means that `mysqld` has received many connection requests from the given host that were interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.
Unblock with 'mysqladmin flush-hosts'
```

The value of the `max_connect_errors` system variable determines how many successive interrupted connection requests are permitted. (See [Section 5.1.7, “Server System Variables”](#).) After `max_connect_errors` failed requests without a successful connection, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you issue a `FLUSH HOSTS` statement or execute a `mysqladmin flush-hosts` command.

By default, `mysqld` blocks a host after 100 connection errors. You can adjust the value by setting `max_connect_errors` at server startup:

```
shell> mysqld_safe --max_connect_errors=10000 &
```

The value can also be set at runtime:

```
mysql> SET GLOBAL max_connect_errors=10000;
```

If you get the `Host 'host_name' is blocked` error message for a given host, you should first verify that there is nothing wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

### B.5.2.6 Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections permitted is controlled by the `max_connections` system variable. The default value is 151 to improve performance when MySQL is used with the Apache Web server. (Previously, the default was 100.) If you need to support more connections, you should set a larger value for this variable.

`mysqld` actually permits `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator who also has the `PROCESS` privilege can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.7.5.29, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL supports depends on the quality of the thread library on a given platform, the amount of RAM available, how much RAM is used for each connection, the workload from each connection, and the desired response time. Linux or Solaris should be able to support at least 500 to 1000 simultaneous connections routinely and as many as 10,000 connections if you have many gigabytes of RAM available and the workload from each is low or the response time target undemanding.

Increasing `open-files-limit` may be necessary. Also see [Section 2.5, “Installing MySQL on Linux”](#), for how to raise the operating system limit on how many handles can be used by MySQL.

### B.5.2.7 Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `--quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

### B.5.2.8 MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent).

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.1.7, “Server System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT, ...)` or

`mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.

- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL does not get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

The solution to this is to either do a `mysql_ping()` on the connection if there has been a long time since the last query (this is what Connector/ODBC does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If `mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 4MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section B.5.2.9, "Packet Too Large"](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- It is also possible to see this error if host name lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working—from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).

You can get more information about the lost connections by starting `mysqld` with the `log_error_verbosity` system variable set to 3. This logs some of the disconnection messages in the `hostname.err` file. See [Section 5.4.2, "The Error Log"](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section B.5.3.3, "What to Do If MySQL Keeps Crashing"](#).

- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section 28.5, “Debugging and Porting MySQL”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the general query log enabled to determine whether the problem query appears in the log? (See [Section 5.4.3, “The General Query Log”](#).)

See also [Section B.5.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.7, “How to Report Bugs or Problems”](#).

### B.5.2.9 Packet Too Large

A communication packet is a single SQL statement sent to the MySQL server, a single row that is sent to the client, or a binary log event sent from a master replication server to a slave.

The largest possible packet that can be transmitted to or from a MySQL 5.7 server or client is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues an `ER_NET_PACKET_TOO_LARGE` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. To set a larger value, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 4MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

It is safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you do not run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

### B.5.2.10 Communication Errors and Aborted Connections

If connection problems occur such as communication errors or aborted connections, use these sources of information to diagnose problems:

- The error log. See [Section 5.4.2, “The Error Log”](#).
- The general query log. See [Section 5.4.3, “The General Query Log”](#).
- The `Aborted_xxx` and `Connection_errors_xxx` status variables. See [Section 5.1.9, “Server Status Variables”](#).
- The host cache, which is accessible using the `host_cache` Performance Schema table. See [Section 8.12.5.2, “DNS Lookup Optimization and the Host Cache”](#), and [Section 25.11.16.1, “The host\\_cache Table”](#).

If the server has the `log_error_verbosity` system variable set to 3, you might find messages like this in your error log:

```
[Note] Aborted connection 854 to db: 'employees' user: 'josh'
```

If a client is unable even to connect, the server increments the `Aborted_connects` status variable. Unsuccessful connection attempts can occur for the following reasons:

- A client attempts to access a database but has no privileges for it.
- A client uses an incorrect password.
- A connection packet does not contain the right information.
- It takes more than `connect_timeout` seconds to obtain a connect packet. See [Section 5.1.7, “Server System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server! If the general query log is enabled, messages for these types of problems are logged to it.

If a client successfully connects but later disconnects improperly or is terminated, the server increments the `Aborted_clients` status variable, and logs an `Aborted connection` message to the error log. The cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.1.7, “Server System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

Other reasons for problems with aborted connections or aborted clients:

- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section B.5.2.9, “Packet Too Large”](#).
- Use of Ethernet protocol with Linux, both half and full duplex. Some Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file using FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. Switch the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and test the results to determine the best setting.
- A problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.

See also [Section B.5.2.8, “MySQL server has gone away”](#).

### B.5.2.11 The table is full

If a table-full error occurs, it may be that the disk is full or that the table has reached its maximum size. The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. See [Section C.10.3, “Limits on Table Size”](#).

### B.5.2.12 Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '...\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.2.6, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the file system is full:

```
shell> pererror 28
OS error code 28: No space left on device
```

If you get an error of the following type during startup, it indicates that the file system or directory used for storing data files is write protected. Provided that the write error is to a test file, the error is not serious and can be safely ignored.

```
Can't create test file /usr/local/mysql/data/master.lower-test
```

### B.5.2.13 Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

### B.5.2.14 Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. Check whether the `Password` column of that table is shorter than 16 characters. If so, correct this condition by running `mysql_upgrade`.
- The account has an old password (eight characters long). Update the account in the `user` table to have a new password.
- You have specified a password in the `user` table without using the `PASSWORD( )` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD( )` function:

```
mysql> UPDATE user SET Password=PASSWORD('new_password')
-> WHERE User='some_user' AND Host='some_host';
```

#### B.5.2.15 Table 'tbl\_name' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a file system that has case-sensitive file names.
- Even for file systems that are not case-sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.7.5, “SHOW Syntax”](#).

#### B.5.2.16 Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multibyte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `CMake` with the `-DDEFAULT_CHARSET=charset_name` or `-DWITH_EXTRA_CHARSETS=charset_name` option. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

All standard MySQL binaries are compiled with `-DWITH_EXTRA_CHARSETS=complex`, which enables support for all multibyte character sets. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.

- Copy the character definition files to the path where the client expects them to be.

### B.5.2.17 File Not Found and Similar Errors

If you get `ERROR 'file_name' not found (errno: 23)`, `Can't open file: file_name (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you have not allocated enough file descriptors for the MySQL server. You can use the `pererror` utility to get a description of what the error number means:

```
shell> pererror 23
OS error code 23: File table overflow
shell> pererror 24
OS error code 24: Too many open files
shell> pererror 11
OS error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_open_cache` system variable (the default value is 64). This may not entirely prevent running out of file descriptors because in some circumstances the server may attempt to extend the cache size temporarily, as described in [Section 8.4.3.1, “How MySQL Opens and Closes Tables”](#). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or set the `open_files_limit` system variable. See [Section 5.1.7, “Server System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.2.6, “Using Option Files”](#). If you have an old version of `mysqld` that does not support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number 256 to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

#### Note

If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

### B.5.2.18 Table-Corruption Issues

If you have started `mysqld` with `--myisam-recover-options`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further.

When the server detects `MyISAM` table corruption, it writes additional information to the error log, such as the name and line number of the source file, and the list of threads accessing the table. Example:

Got an error from `thread_id=1, mi_dynrec.c:368`. This is useful information to include in bug reports.

See also [Section 5.1.6, “Server Command Options”](#), and [Section 28.5.1.7, “Making a Test Case If You Experience Table Corruption”](#).

## B.5.3 Administration-Related Issues

### B.5.3.1 Problems with File Permissions

If you have problems with file permissions, the `UMASK` or `UMASK_DIR` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` and `UMASK_DIR` values are `0640` and `0750`, respectively (`0660` and `0700` prior to MySQL 5.7.6). MySQL assumes that the value for `UMASK` or `UMASK_DIR` is in octal if it starts with a zero. For example, setting `UMASK=0600` is equivalent to `UMASK=384` because `0600` octal is `384` decimal.

To change the default `UMASK` value, start `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database directories with an access permission value of `0750`. To modify this behavior, set the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, to give group access to all new directories, start `mysqld_safe` as follows:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

For additional details, see [Section 4.9, “MySQL Program Environment Variables”](#).

### B.5.3.2 How to Reset the Root Password

If you have never assigned a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, this is insecure. For instructions on assigning a password, see [Section 2.10.4, “Securing the Initial MySQL Account”](#).

If you know the `root` password and want to change it, see [Section 13.7.1.1, “ALTER USER Syntax”](#), and [Section 13.7.1.7, “SET PASSWORD Syntax”](#).

If you assigned a `root` password previously but have forgotten it, you can assign a new password. The following sections provide instructions for Windows and Unix and Unix-like systems, as well as generic instructions that apply to any system.

#### Resetting the Root Password: Windows Systems

On Windows, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

1. Log on to your system as Administrator.

2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

MySQL 5.7.6 and later:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

4. Save the file. This example assumes that you name the file `C:\mysql-init.txt`.
5. Open a console window to get to the command prompt: From the **Start** menu, select **Run**, then enter `cmd` as the command to be run.
6. Start the MySQL server with the special `--init-file` option (notice that the backslash in the option value is doubled):

```
C:\> cd "C:\Program Files\MySQL\MySQL Server 5.7\bin"
C:\> mysqld --init-file=C:\mysql-init.txt
```

If you installed MySQL to a different location, adjust the `cd` command accordingly.

The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

To have server output to appear in the console window rather than in a log file, add the `--console` option to the `mysqld` command.

If you installed MySQL using the MySQL Installation Wizard, you may need to specify a `--defaults-file` option. For example:

```
C:\> mysqld
      --defaults-file="C:\\ProgramData\\MySQL\\MySQL Server 5.7\\my.ini"
      --init-file=C:\\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager: From the **Start** menu, select **Control Panel**, then **Administrative Tools**, then **Services**. Find the MySQL service in the list, right-click it, and choose the **Properties** option. The **Path to executable** field contains the `--defaults-file` setting.

7. After the server has started successfully, delete `C:\mysql-init.txt`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the MySQL server and restart it normally. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user
  SET authentication_string = PASSWORD('MyNewPass'), password_expired = 'N'
  WHERE User = 'root' AND Host = 'localhost';
```

```
FLUSH PRIVILEGES;
```

## Resetting the Root Password: Unix and Unix-Like Systems

On Unix, use the following procedure to reset the password for the MySQL `'root'@'localhost'` account. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

The instructions assume that you will start the MySQL server from the Unix login account that you normally use for running it. For example, if you run the server using the `mysql` login account, you should log in as `mysql` before using the instructions. Alternatively, you can log in as `root`, but in this case you *must* start `mysqld` with the `--user=mysql` option. If you start the server as `root` without using `--user=mysql`, the server may create `root`-owned files in the data directory, such as log files, and these may cause permission-related problems for future server startups. If that happens, you will need to either change the ownership of the files to `mysql` or remove them.

1. Log on to your system as the Unix user that the MySQL server runs as (for example, `mysql`).
2. Stop the MySQL server if it is running. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, host name, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the file name has an extension of `.pid` and begins with either `mysqld` or your system's host name.

Stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process. Use the actual path name of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Use backticks (not forward quotation marks) with the `cat` command. These cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file containing the password-assignment statement on a single line. Replace the password with the password that you want to use.

MySQL 5.7.6 and later:

```
ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

4. Save the file. This example assumes that you name the file `/home/me/mysql-init`. The file contains the password, so do not save it where it can be read by other users. If you are not logged in as `mysql` (the user the server runs as), make sure that the file has permissions that permit `mysql` to read it.
5. Start the MySQL server with the special `--init-file` option:

```
shell> mysqld --init-file=/home/me/mysql-init &
```

The server executes the contents of the file named by the `--init-file` option at startup, changing the `'root'@'localhost'` account password.

Other options may be necessary as well, depending on how you normally start your server. For example, `--defaults-file` may be needed before `--init-file`.

6. After the server has started successfully, delete `/home/me/mysql-init`.

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally.

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user
  SET authentication_string = PASSWORD('MyNewPass'), password_expired = 'N'
  WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```

## Resetting the Root Password: Generic Instructions

The preceding sections provide password-resetting instructions specifically for Windows and Unix and Unix-like systems. Alternatively, on any platform, you can reset the password using the `mysql` client (but this approach is less secure):

1. Stop the MySQL server if necessary, then restart it with the `--skip-grant-tables` option. This enables anyone to connect without a password and with all privileges, and disables account-management statements such as `ALTER USER` and `SET PASSWORD`. Because this is insecure, you might want to use `--skip-grant-tables` in conjunction with `--skip-networking` to prevent remote clients from connecting.
2. Connect to the MySQL server using the `mysql` client; no password is necessary because the server was started with `--skip-grant-tables`:

```
shell> mysql
```

3. In the `mysql` client, tell the server to reload the grant tables so that account-management statements work:

```
mysql> FLUSH PRIVILEGES;
```

Then change the `'root'@'localhost'` account password. Replace the password with the password that you want to use. To change the password for a `root` account with a different host name part, modify the instructions to use that host name.

MySQL 5.7.6 and later:

```
mysql> ALTER USER 'root'@'localhost' IDENTIFIED BY 'MyNewPass';
```

MySQL 5.7.5 and earlier:

```
mysql> SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPass');
```

You should now be able to connect to the MySQL server as `root` using the new password. Stop the server and restart it normally (without the `--skip-grant-tables` and `--skip-networking` options).

If the `ALTER USER` statement fails to reset the password, try repeating the procedure using the following statements to modify the `user` table directly:

```
UPDATE mysql.user SET authentication_string = PASSWORD('MyNewPass')
WHERE User = 'root' AND Host = 'localhost';
FLUSH PRIVILEGES;
```

## B.5.3.3 What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This does not mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you

have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.4.2, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [Section 28.5, “Debugging and Porting MySQL”](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that does not support good file system locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it is at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */*.MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, MySQL Server Administration](#).
- Start `mysqld` with the general query log enabled (see [Section 5.4.3, “The General Query Log”](#)). Then try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.4.3, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have isolated the bug and should submit a bug report for it. See [Section 1.7, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section 28.5, “Debugging and Porting MySQL”](#).
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- Configuring MySQL for debugging makes it much easier to gather information about possible errors if something goes wrong. Reconfigure MySQL with the `-DWITH_DEBUG=1` option to `CMake` and then recompile. See [Section 28.5, “Debugging and Porting MySQL”](#).

- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- If `mysqld` appears to be running but not responding, try `mysqladmin -u root processlist`. Sometimes `mysqld` is not hung even though it seems unresponsive. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while running other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section 28.5, “Debugging and Porting MySQL”](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.7, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, the crash might result from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Consider the possibility of hardware faults when diagnosing problems. Defective hardware can be the cause of data corruption. Pay particular attention to your memory and disk subsystems when troubleshooting hardware.

### B.5.3.4 How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. It also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- Alternatively, to abort the thread, use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition enables the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

### B.5.3.5 Where MySQL Stores Temporary Files

On Unix, MySQL uses the value of the `TMPDIR` environment variable as the path name of the directory in which to store temporary files. If `TMPDIR` is not set, MySQL uses the system default, which is usually `/tmp`, `/var/tmp`, or `/usr/tmp`.

On Windows, MySQL checks in order the values of the `TMPDIR`, `TEMP`, and `TMP` environment variables. For the first one found to be set, MySQL uses it and does not check those remaining. If none of `TMPDIR`, `TEMP`, or `TMP` are set, MySQL uses the Windows system default, which is usually `C:\windows\temp\`.

If the file system containing your temporary file directory is too small, you can use the `mysqld --tmpdir` option to specify a directory in a file system where you have enough space. On replication slaves, you can use `--slave-load-tmpdir` to specify a separate directory for holding temporary files when replicating `LOAD DATA INFILE` statements.

The `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (:) on Unix and semicolon characters (;) on Windows.

#### Note

To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should be sure to set `--slave-load-tmpdir` not to point to a directory that is on a memory-based file system or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the slave temporary file directory are lost when the server restarts, replication fails.

MySQL arranges that temporary files are removed if `mysqld` is terminated. On platforms that support it (such as Unix), this is done by unlinking the file after opening it. The disadvantage of this is that the name does not appear in directory listings and you do not see a big temporary file that fills up the file

system in which the temporary file directory is located. (In such cases, `ls -l` may be helpful in identifying large files associated with `mysqld`.)

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

DDL operations that rebuild the table and are not performed online using the `ALGORITHM=INPLACE` technique create a temporary copy of the original table in the same directory as the original table.

Online DDL operations may use temporary log files for recording concurrent DML, temporary sort files when creating an index, and temporary intermediate tables files when rebuilding the table. For more information, see [Section 14.13.3, “Online DDL Space Requirements”](#).

InnoDB non-compressed, user-created temporary tables and on-disk internal temporary tables are created in a temporary tablespace file named `ibtmp1` in the MySQL data directory. For more information, see [Section 14.4.12, “Temporary Tablespace”](#).

### B.5.3.6 How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.2.6, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.

- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `MYSQL_UNIX_ADDR` option when you run `CMake`. See [Section 2.9.4, “MySQL Source-Configuration Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

### B.5.3.7 Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Section 4.9, “MySQL Program Environment Variables”](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The permissible values for `--timezone` or `TZ` are system dependent. Consult your operating system documentation to see what values are acceptable.

## B.5.4 Query-Related Issues

### B.5.4.1 Case Sensitivity in String Searches

For nonbinary strings (`CHAR`, `VARCHAR`, `TEXT`), string searches use the collation of the comparison operands. For binary strings (`BINARY`, `VARBINARY`, `BLOB`), comparisons use the numeric values of the bytes in the operands; this means that for alphabetic characters, comparisons will be case-sensitive.

A comparison between a nonbinary string and binary string is treated as a comparison of binary strings.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character’s “sort value.” Characters with the same sort value are treated as the same character. For example, if `e` and `é` have the same sort value in a given collation, they compare as equal.

The default character set and collation are `latin1` and `latin1_swedish_ci`, so nonbinary string comparisons are case insensitive by default. This means that if you search with `col_name LIKE 'a %'`, you get all column values that start with `A` or `a`. To make this search case-sensitive, make sure that one of the operands has a case-sensitive or binary collation. For example, if you are comparing a column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case-sensitive or binary collation. See [Section 13.1.18, “CREATE TABLE Syntax”](#).

To cause a case-sensitive comparison of nonbinary strings to be case insensitive, use `COLLATE` to name a case-insensitive collation. The strings in the following example normally are case-sensitive, but `COLLATE` changes the comparison to be case insensitive:

```
mysql> SET @s1 = 'MySQL' COLLATE latin1_bin,
->      @s2 = 'mysql' COLLATE latin1_bin;
mysql> SELECT @s1 = @s2;
+-----+
```

```
| @s1 = @s2 |
+-----+
|          0 |
+-----+
mysql> SELECT @s1 COLLATE latin1_swedish_ci = @s2;
+-----+
| @s1 COLLATE latin1_swedish_ci = @s2 |
+-----+
|                                     1 |
+-----+
```

A binary string is case-sensitive in comparisons. To compare the string as case insensitive, convert it to a nonbinary string and use `COLLATE` to name a case-insensitive collation:

```
mysql> SET @s = BINARY 'MySQL';
mysql> SELECT @s = 'mysql';
+-----+
| @s = 'mysql' |
+-----+
|          0 |
+-----+
mysql> SELECT CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql';
+-----+
| CONVERT(@s USING latin1) COLLATE latin1_swedish_ci = 'mysql' |
+-----+
|                                     1 |
+-----+
```

To determine whether a value will compare as a nonbinary or binary string, use the `COLLATION()` function. This example shows that `VERSION()` returns a string that has a case-insensitive collation, so comparisons are case insensitive:

```
mysql> SELECT COLLATION(VERSION());
+-----+
| COLLATION(VERSION()) |
+-----+
| utf8_general_ci      |
+-----+
```

For binary strings, the collation value is `binary`, so comparisons will be case sensitive. One context in which you will see `binary` is for compression functions, which return binary strings as a general rule: string:

```
mysql> SELECT COLLATION(COMPRESS('x'));
+-----+
| COLLATION(COMPRESS('x')) |
+-----+
| binary                   |
+-----+
```

To check the sort value of a string, the `WEIGHT_STRING()` may be helpful. See [Section 12.5, “String Functions”](#).

### B.5.4.2 Problems Using DATE Columns

The format of a `DATE` value is `'YYYY-MM-DD'`. According to standard SQL, no other format is permitted. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
SELECT * FROM t1 WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context and vice versa. MySQL also permits a “relaxed” string format when updating and in a `WHERE` clause that compares a date to a `DATE`, `DATETIME`, or `TIMESTAMP` column. “Relaxed” format

means that any punctuation character may be used as the separator between parts. For example, '2004-08-15' and '2004#08#15' are equivalent. MySQL can also convert a string containing no separators (such as '20040815'), provided it makes sense as a date.

When you compare a [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#) to a constant string with the [<](#), [<=](#), [=](#), [>=](#), [>](#), or [BETWEEN](#) operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a [DATE](#), [TIME](#), [DATETIME](#), or [TIMESTAMP](#) column to an expression
- When you use any comparison method other than those just listed, such as [IN](#) or [STRCMP\(\)](#).

For those exceptions, the comparison is done by converting the objects to strings and performing a string comparison.

To be on the safe side, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special “zero” date '0000-00-00' can be stored and retrieved as '0000-00-00'. When a '0000-00-00' date is used through Connector/ODBC, it is automatically converted to [NULL](#) because ODBC cannot handle that kind of date.

Because MySQL performs the conversions just described, the following statements work (assume that [idate](#) is a [DATE](#) column):

```
INSERT INTO t1 (idate) VALUES (19970505);
INSERT INTO t1 (idate) VALUES ('19970505');
INSERT INTO t1 (idate) VALUES ('97-05-05');
INSERT INTO t1 (idate) VALUES ('1997.05.05');
INSERT INTO t1 (idate) VALUES ('1997 05 05');
INSERT INTO t1 (idate) VALUES ('0000-00-00');

SELECT idate FROM t1 WHERE idate >= '1997-05-05';
SELECT idate FROM t1 WHERE idate >= 19970505;
SELECT MOD(idate,100) FROM t1 WHERE idate >= 19970505;
SELECT idate FROM t1 WHERE idate >= '19970505';
```

However, the following statement does not work:

```
SELECT idate FROM t1 WHERE STRCMP(idate,'20030505')=0;
```

[STRCMP\(\)](#) is a string function, so it converts [idate](#) to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If you enable the [ALLOW\\_INVALID\\_DATES](#) SQL mode, MySQL permits you to store dates that are given only limited checking: MySQL requires only that the day is in the range from 1 to 31 and the month is in the range from 1 to 12. This makes MySQL very convenient for Web applications where you obtain year, month, and day in three different fields and you want to store exactly what the user inserted (without date validation).

MySQL permits you to store dates where the day or month and day are zero. This is convenient if you want to store a birthdate in a [DATE](#) column and you know only part of the date. To disallow zero month or day parts in dates, enable the [NO\\_ZERO\\_IN\\_DATE](#) mode.

MySQL permits you to store a “zero” value of '0000-00-00' as a “dummy date.” This is in some cases more convenient than using [NULL](#) values. If a date to be stored in a [DATE](#) column cannot be converted to any reasonable value, MySQL stores '0000-00-00'. To disallow '0000-00-00', enable the [NO\\_ZERO\\_DATE](#) mode.

To have MySQL check all dates and accept only legal dates (unless overridden by `IGNORE`), set the `sql_mode` system variable to `"NO_ZERO_IN_DATE,NO_ZERO_DATE"`.

### B.5.4.3 Problems with NULL Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string `' '`. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

To search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with NULL Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using the `MyISAM`, `InnoDB`, or `MEMORY` storage engine. Otherwise, you must declare an indexed column `NOT NULL`, and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. To load a `NULL` value into a column, use `\N` in the data file. The literal word `NULL` may also be used under some circumstances. See [Section 13.2.6, “LOAD DATA INFILE Syntax”](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer or floating-point column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

#### B.5.4.4 Problems with Column Aliases

An alias can be used in a query select list to give a column a different name. You can use the alias in `GROUP BY`, `ORDER BY`, or `HAVING` clauses to refer to the column:

```
SELECT SQRT(a*b) AS root FROM tbl_name
  GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name
  GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL disallows references to column aliases in a `WHERE` clause. This restriction is imposed because when the `WHERE` clause is evaluated, the column value may not yet have been determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name
  WHERE cnt > 0 GROUP BY id;
```

The `WHERE` clause determines which rows should be included in the `GROUP BY` clause, but it refers to the alias of a column value that is not known until after the rows have been selected, and grouped by the `GROUP BY`.

In the select list of a query, a quoted column alias can be specified using identifier or string quoting characters:

```
SELECT 1 AS `one`, 2 AS 'two';
```

Elsewhere in the statement, quoted references to the alias must use identifier quoting or the reference is treated as a string literal. For example, this statement groups by the values in column `id`, referenced using the alias ``a``:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY `a`;
```

But this statement groups by the literal string `'a'` and will not work as expected:

```
SELECT id AS 'a', COUNT(*) AS cnt FROM tbl_name
  GROUP BY 'a';
```

#### B.5.4.5 Rollback Failure for Nontransactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These nontransactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and nontransactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` does not support a storage engine, it instead creates the table as a `MyISAM` table, which is nontransactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';  
SHOW CREATE TABLE tbl_name;
```

See [Section 13.7.5.36, “SHOW TABLE STATUS Syntax”](#), and [Section 13.7.5.10, “SHOW CREATE TABLE Syntax”](#).

To check which storage engines your `mysqld` server supports, use this statement:

```
SHOW ENGINES;
```

See [Section 13.7.5.16, “SHOW ENGINES Syntax”](#) for full details.

### B.5.4.6 Deleting Rows from Related Tables

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

### B.5.4.7 Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that returns no rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 13.8.2, “EXPLAIN Syntax”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it is a good idea to use `LIMIT 10` with the query.
4. Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
5. If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you cannot use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section B.5.4.8, “Problems with Floating-Point Values”](#).
6. If you still cannot figure out what is wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2  
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.7, “How to Report Bugs or Problems”](#).

### B.5.4.8 Problems with Floating-Point Values

Floating-point numbers sometimes cause confusion because they are approximate and not stored as exact values. A floating-point value as written in an SQL statement may not be the same as the value

represented internally. Attempts to treat floating-point values as exact in comparisons may lead to problems. They are also subject to platform or implementation dependencies. The `FLOAT` and `DOUBLE` data types are subject to these issues. For `DECIMAL` columns, MySQL performs operations with a precision of 65 decimal digits, which should solve most common inaccuracy problems.

The following example uses `DOUBLE` to demonstrate how calculations that are done using floating-point operations are subject to floating-point error.

```
mysql> CREATE TABLE t1 (i INT, d1 DOUBLE, d2 DOUBLE);
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.4	21.4
2	76.8	76.8
3	7.4	7.4
4	15.4	15.4
5	7.2	7.2
6	-51.4	0

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

If columns `d1` and `d2` had been defined as `DECIMAL` rather than `DOUBLE`, the result of the `SELECT` query would have contained only one row—the last one shown above.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;

+-----+-----+-----+
| i    | a    | b    |
+-----+-----+-----+
| 6    | -51.4 | 0    |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;

+-----+-----+-----+
| i    | a    | b    |
+-----+-----+-----+
| 1    | 21.4 | 21.4 |
| 2    | 76.8 | 76.8 |
| 3    | 7.4  | 7.4  |
+-----+-----+-----+
```

```
| 4 | 15.4 | 15.4 |
| 5 | 7.2 | 7.2 |
+-----+-----+
5 rows in set (0.03 sec)
```

Floating-point values are subject to platform or implementation dependencies. Suppose that you execute the following statements:

```
CREATE TABLE t1(c1 FLOAT(53,0), c2 FLOAT(53,0));
INSERT INTO t1 VALUES('1e+52', '-1e+52');
SELECT * FROM t1;
```

On some platforms, the `SELECT` statement returns `inf` and `-inf`. On others, it returns `0` and `-0`.

An implication of the preceding issues is that if you attempt to create a replication slave by dumping table contents with `mysqldump` on the master and reloading the dump file into the slave, tables containing floating-point columns might differ between the two hosts.

## B.5.5 Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL does not have enough information about the data at hand and has to make “educated” guesses about the data.

For the cases when MySQL does not do the “right” thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 13.8.2, “EXPLAIN Syntax”](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.7.2.1, “ANALYZE TABLE Syntax”](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index:

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful. See [Section 8.9.4, “Index Hints”](#).

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.9, “SELECT Syntax”](#).
- You can tune global or thread-specific system variables. For example, start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.1.7, “Server System Variables”](#).

## B.5.6 Table Definition-Related Issues

### B.5.6.1 Problems with ALTER TABLE

If you get a duplicate-key error when using `ALTER TABLE` to change the character set or collation of a character column, the cause is either that the new column collation maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table. `REPAIR TABLE` works for `MyISAM`, `ARCHIVE`, and `CSV` tables.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

### B.5.6.2 TEMPORARY Table Problems

Temporary tables created with `CREATE TEMPORARY TABLE` have the following limitations:

- `TEMPORARY` tables are supported only by the `InnoDB`, `MEMORY`, `MyISAM`, and `MERGE` storage engines.
- Temporary tables are not supported for NDB Cluster.
- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- To rename `TEMPORARY` tables, `RENAME TABLE` does not work. Use `ALTER TABLE` instead:

```
ALTER TABLE old_name RENAME new_name;
```

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
SELECT * FROM temp_table JOIN temp_table AS t2;
```

The statement produces this error:

```
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `Can't reopen table` error also occurs if you refer to a temporary table multiple times in a stored function under different aliases, even if the references occur in different statements within the function. It may occur for temporary tables created outside stored functions and referred to across multiple calling and callee functions.
- There are known issues in using temporary tables with replication. See [Section 16.4.1.30, "Replication and Temporary Tables"](#), for more information.

## B.5.7 Known Issues in MySQL

This section lists known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.1, “General Installation Guidance”](#), and [Section 28.5, “Debugging and Porting MySQL”](#).

The following problems are known:

- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names for the function `DATABASE()` or within the various logs (on case-insensitive systems).
- Dropping a `FOREIGN KEY` constraint does not work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` does not work inside `GROUP_CONCAT()` if you do not use all and only those columns that are in the `DISTINCT` list.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- With statement-based binary logging, the master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases. However, it is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is nondeterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE TABLE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic order.**

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned nondeterministic queries to ensure that the rows are always stored or modified in the same order. Using row-based or mixed logging format also avoids the problem.

- Log file names are based on the server host name if you do not specify a file name with the startup option. To retain the same log file names if you change your host name to something else, you must explicitly use options such as `--log-bin=old_host_name-bin`. See [Section 5.1.6, “Server Command Options”](#). Alternatively, rename the old files to reflect your host name change. If these are binary logs, you must edit the binary log index file and fix the binary log file names there as well. (The same is true for the relay logs on a slave server.)
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` statement. See [Section 4.6.7, “mysqlbinlog — Utility for Processing Binary Log Files”](#).
- `RENAME` does not work with `TEMPORARY` tables or tables used in a `MERGE` table.
- When using `SET CHARACTER SET`, you cannot use translated characters in database, table, and column names.
- You cannot use `_` or `%` with `ESCAPE` in `LIKE ... ESCAPE`.
- The server uses only the first `max_sort_length` bytes when comparing data values. This means that values cannot reliably be used in `GROUP BY`, `ORDER BY`, or `DISTINCT` if they differ only after the first `max_sort_length` bytes. To work around this, increase the variable value. The default value of `max_sort_length` is 1024 and can be changed at server startup time or at runtime.
- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF()` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, **not** 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;  
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns do not participate in the `DISTINCT` comparison.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads  
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, you may get two identical rows in the result set (because the values in the hidden `id` column may differ).

Note that this happens only for queries that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` does not check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries or views.

### C.1 Restrictions on Stored Programs

These restrictions apply to the features described in [Chapter 23, \*Stored Programs and Views\*](#).

Some of the restrictions noted here apply to all stored routines; that is, both to stored procedures and stored functions. There are also some [restrictions specific to stored functions](#) but not to stored procedures.

The restrictions for stored functions also apply to triggers. There are also some [restrictions specific to triggers](#).

The restrictions for stored procedures also apply to the `DO` clause of Event Scheduler event definitions. There are also some [restrictions specific to events](#).

### SQL Statements Not Permitted in Stored Routines

Stored routines cannot contain arbitrary SQL statements. The following statements are not permitted:

- The locking statements `LOCK TABLES` and `UNLOCK TABLES`.
- `ALTER VIEW`.
- `LOAD DATA` and `LOAD TABLE`.
- SQL prepared statements (`PREPARE`, `EXECUTE`, `DEALLOCATE PREPARE`) can be used in stored procedures, but not stored functions or triggers. Thus, stored functions and triggers cannot use dynamic SQL (where you construct statements as strings and then execute them).
- Generally, statements not permitted in SQL prepared statements are also not permitted in stored programs. For a list of statements supported as prepared statements, see [Section 13.5, “Prepared SQL Statement Syntax”](#). Exceptions are `SIGNAL`, `RESIGNAL`, and `GET DIAGNOSTICS`, which are not permissible as prepared statements but are permitted in stored programs.

- Because local variables are in scope only during stored program execution, references to them are not permitted in prepared statements created within a stored program. Prepared statement scope is the current session, not the stored program, so the statement could be executed after the program ends, at which point the variables would no longer be in scope. For example, `SELECT ... INTO local_var` cannot be used as a prepared statement. This restriction also applies to stored procedure and function parameters. See [Section 13.5.1, “PREPARE Syntax”](#).
- Within all stored programs (stored procedures and functions, triggers, and events), the parser treats `BEGIN [WORK]` as the beginning of a `BEGIN ... END` block. To begin a transaction in this context, use `START TRANSACTION` instead.

## Restrictions for Stored Functions

The following additional statements or operations are not permitted within stored functions. They are permitted within stored procedures, except stored procedures that are invoked from within a stored function or trigger. For example, if you use `FLUSH` in a stored procedure, that stored procedure cannot be called from a stored function or trigger.

- Statements that perform explicit or implicit commit or rollback. Support for these statements is not required by the SQL standard, which states that each DBMS vendor may decide whether to permit them.
- Statements that return a result set. This includes `SELECT` statements that do not have an `INTO var_list` clause and other statements such as `SHOW`, `EXPLAIN`, and `CHECK TABLE`. A function can process a result set either with `SELECT ... INTO var_list` or by using a cursor and `FETCH` statements. See [Section 13.2.9.1, “SELECT ... INTO Syntax”](#), and [Section 13.6.6, “Cursors”](#).
- `FLUSH` statements.
- Stored functions cannot be used recursively.
- A stored function or trigger cannot modify a table that is already being used (for reading or writing) by the statement that invoked the function or trigger.
- If you refer to a temporary table multiple times in a stored function under different aliases, a `Can't reopen table: 'tbl_name'` error occurs, even if the references occur in different statements within the function.
- `HANDLER ... READ` statements that invoke stored functions can cause replication errors and are disallowed.

## Restrictions for Triggers

For triggers, the following additional restrictions apply:

- Triggers are not activated by foreign key actions.
- When using row-based replication, triggers on the slave are not activated by statements originating on the master. The triggers on the slave are activated when using statement-based replication. For more information, see [Section 16.4.1.35, “Replication and Triggers”](#).
- The `RETURN` statement is not permitted in triggers, which cannot return a value. To exit a trigger immediately, use the `LEAVE` statement.
- Triggers are not permitted on tables in the `mysql` database. Nor are they permitted on `INFORMATION_SCHEMA` or `performance_schema` tables. Those tables are actually views and triggers are not permitted on views.
- The trigger cache does not detect when metadata of the underlying objects has changed. If a trigger uses a table and the table has changed since the trigger was loaded into the cache, the trigger operates using the outdated metadata.

## Name Conflicts within Stored Routines

The same identifier might be used for a routine parameter, a local variable, and a table column. Also, the same local variable name can be used in nested blocks. For example:

```
CREATE PROCEDURE p (i INT)
BEGIN
  DECLARE i INT DEFAULT 0;
  SELECT i FROM t;
  BEGIN
    DECLARE i INT DEFAULT 1;
    SELECT i FROM t;
  END;
END;
```

In such cases, the identifier is ambiguous and the following precedence rules apply:

- A local variable takes precedence over a routine parameter or table column.
- A routine parameter takes precedence over a table column.
- A local variable in an inner block takes precedence over a local variable in an outer block.

The behavior that variables take precedence over table columns is nonstandard.

## Replication Considerations

Use of stored routines can cause replication problems. This issue is discussed further in [Section 23.7, “Binary Logging of Stored Programs”](#).

The `--replicate-wild-do-table=db_name.tbl_name` option applies to tables, views, and triggers. It does not apply to stored procedures and functions, or events. To filter statements operating on the latter objects, use one or more of the `--replicate-*-db` options.

## Debugging Considerations

There are no stored routine debugging facilities.

## Unsupported Syntax from the SQL:2003 Standard

The MySQL stored routine syntax is based on the SQL:2003 standard. The following items from that standard are not currently supported:

- `UNDO` handlers
- `FOR` loops

## Concurrency Considerations

To prevent problems of interaction between sessions, when a client issues a statement, the server uses a snapshot of routines and triggers available for execution of the statement. That is, the server calculates a list of procedures, functions, and triggers that may be used during execution of the statement, loads them, and then proceeds to execute the statement. While the statement executes, it does not see changes to routines performed by other sessions.

For maximum concurrency, stored functions should minimize their side-effects; in particular, updating a table within a stored function can reduce concurrent operations on that table. A stored function acquires table locks before executing, to avoid inconsistency in the binary log due to mismatch of the order in which statements execute and when they appear in the log. When statement-based binary logging is used, statements that invoke a function are recorded rather than the statements executed

within the function. Consequently, stored functions that update the same underlying tables do not execute in parallel. In contrast, stored procedures do not acquire table-level locks. All statements executed within stored procedures are written to the binary log, even for statement-based binary logging. See [Section 23.7, “Binary Logging of Stored Programs”](#).

## Event Scheduler Restrictions

The following limitations are specific to the Event Scheduler:

- Event names are handled in case-insensitive fashion. For example, you cannot have two events in the same database with the names `anEvent` and `AnEvent`.
- An event may not be created, altered, or dropped by a stored routine, trigger, or another event. An event also may not create, alter, or drop stored routines or triggers. (Bug #16409, Bug #18896)
- DDL statements on events are prohibited while a `LOCK TABLES` statement is in effect.
- Event timings using the intervals `YEAR`, `QUARTER`, `MONTH`, and `YEAR_MONTH` are resolved in months; those using any other interval are resolved in seconds. There is no way to cause events scheduled to occur at the same second to execute in a given order. In addition—due to rounding, the nature of threaded applications, and the fact that a nonzero length of time is required to create events and to signal their execution—events may be delayed by as much as 1 or 2 seconds. However, the time shown in the `INFORMATION_SCHEMA.EVENTS` table's `LAST_EXECUTED` column or the `mysql.event` table's `last_executed` column is always accurate to within one second of the actual event execution time. (See also Bug #16522.)
- Each execution of the statements contained in the body of an event takes place in a new connection; thus, these statements has no effect in a given user session on the server's statement counts such as `Com_select` and `Com_insert` that are displayed by `SHOW STATUS`. However, such counts are updated in the global scope. (Bug #16422)
- Events do not support times later than the end of the Unix Epoch; this is approximately the beginning of the year 2038. Such dates are specifically not permitted by the Event Scheduler. (Bug #16396)
- References to stored functions, user-defined functions, and tables in the `ON SCHEDULE` clauses of `CREATE EVENT` and `ALTER EVENT` statements are not supported. These sorts of references are not permitted. (See Bug #22830 for more information.)

**Stored routines and triggers in NDB Cluster.** Stored procedures, stored functions, and triggers are all supported by tables using the `NDB` storage engine; however, it is important to keep in mind that they do *not* propagate automatically between MySQL Servers acting as Cluster SQL nodes. This is because of the following:

- Stored routine definitions are kept in tables in the `mysql` system database using the `MyISAM` storage engine, and so do not participate in clustering.
- The `.TRN` and `.TRG` files containing trigger definitions are not read by the `NDB` storage engine, and are not copied between Cluster nodes.

Any stored routine or trigger that interacts with `NDB Cluster` tables must be re-created by running the appropriate `CREATE PROCEDURE`, `CREATE FUNCTION`, or `CREATE TRIGGER` statements on each MySQL Server that participates in the cluster where you wish to use the stored routine or trigger. Similarly, any changes to existing stored routines or triggers must be carried out explicitly on all Cluster SQL nodes, using the appropriate `ALTER` or `DROP` statements on each MySQL Server accessing the cluster.

### Warning

Do *not* attempt to work around the issue described in the first item mentioned previously by converting any `mysql` database tables to use the `NDB` storage

engine. Altering the system tables in the [mysql](#) database is not supported and is very likely to produce undesirable results.

## C.2 Restrictions on Condition Handling

[SIGNAL](#), [RESIGNAL](#), and [GET DIAGNOSTICS](#) are not permissible as prepared statements. For example, this statement is invalid:

```
PREPARE stmt1 FROM 'SIGNAL SQLSTATE "02000"';
```

[SQLSTATE](#) values in class '04' are not treated specially. They are handled the same as other exceptions.

In standard SQL, the first condition relates to the [SQLSTATE](#) value returned for the previous SQL statement. In MySQL, this is not guaranteed, so to get the main error, you cannot do this:

```
GET DIAGNOSTICS CONDITION 1 @errno = MYSQL_ERRNO;
```

Instead, do this:

```
GET DIAGNOSTICS @cno = NUMBER;
GET DIAGNOSTICS CONDITION @cno @errno = MYSQL_ERRNO;
```

## C.3 Restrictions on Server-Side Cursors

Server-side cursors are implemented in the C API using the [mysql\\_stmt\\_attr\\_set\(\)](#) function. The same implementation is used for cursors in stored routines. A server-side cursor enables a result set to be generated on the server side, but not transferred to the client except for those rows that the client requests. For example, if a client executes a query but is only interested in the first row, the remaining rows are not transferred.

In MySQL, a server-side cursor is materialized into an internal temporary table. Initially, this is a [MEMORY](#) table, but is converted to a [MyISAM](#) table when its size exceeds the minimum value of the [max\\_heap\\_table\\_size](#) and [tmp\\_table\\_size](#) system variables. The same restrictions apply to internal temporary tables created to hold the result set for a cursor as for other uses of internal temporary tables. See [Section 8.4.4, "Internal Temporary Table Use in MySQL"](#). One limitation of the implementation is that for a large result set, retrieving its rows through a cursor might be slow.

Cursors are read only; you cannot use a cursor to update rows.

[UPDATE WHERE CURRENT OF](#) and [DELETE WHERE CURRENT OF](#) are not implemented, because updatable cursors are not supported.

Cursors are nonholdable (not held open after a commit).

Cursors are asensitive.

Cursors are nonscrollable.

Cursors are not named. The statement handler acts as the cursor ID.

You can have open only a single cursor per prepared statement. If you need several cursors, you must prepare several statements.

You cannot use a cursor for a statement that generates a result set if the statement is not supported in prepared mode. This includes statements such as [CHECK TABLE](#), [HANDLER READ](#), and [SHOW BINLOG EVENTS](#).

## C.4 Restrictions on Subqueries

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);
UPDATE t ... WHERE col = (SELECT ... FROM t ...);
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if for the modified table you are using a derived table and that derived table is materialized rather than merged into the outer query. (See [Section 8.2.2.3, “Optimizing Derived Tables and View References”](#).) Example:

```
UPDATE t ... WHERE col = (SELECT * FROM (SELECT ... FROM t...) AS dt ...);
```

Here the result from the derived table is materialized as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For `expr [NOT] IN subquery`, `expr` can be an *n*-tuple (specified using row constructor syntax) and the subquery can return rows of *n*-tuples. The permitted syntax is therefore more specifically expressed as `row_constructor [NOT] IN table_subquery`
  - For `expr op {ALL|ANY|SOME} subquery`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of *n*-tuples, this is supported:

```
(expr_1, ..., expr_n) [NOT] IN table_subquery
```

But this is not supported:

```
(expr_1, ..., expr_n) op {ALL|ANY|SOME} subquery
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized in whole (evaluated to produce a result set) during query execution, so they cannot be evaluated per row of the outer query. The optimizer delays materialization until the result is needed, which may permit materialization to be avoided. See [Section 8.2.2.3, “Optimizing Derived Tables and View References”](#).
- MySQL does not support `LIMIT` in subqueries for certain subquery operators:

```
mysql> SELECT * FROM t1
      WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1);
ERROR 1235 (42000): This version of MySQL doesn't yet support
'LIMIT & IN/ALL/ANY/SOME subquery'
```

- MySQL permits a subquery to refer to a stored function that has data-modifying side effects such as inserting rows into a table. For example, if `f()` inserts rows, the following query can modify data:

```
SELECT ... WHERE x IN (SELECT f() ...);
```

This behavior is an extension to the SQL standard. In MySQL, it can produce nondeterministic results because `f()` might be executed a different number of times for different executions of a given query depending on how the optimizer chooses to handle it.

For statement-based or mixed-format replication, one implication of this indeterminism is that such a query can produce different results on the master and its slaves.

## C.5 Restrictions on Views

View processing is not optimized:

- It is not possible to create an index on a view.
- Indexes can be used for views processed using the merge algorithm. However, a view that is processed with the temptable algorithm is unable to take advantage of indexes on its underlying tables (although indexes can be used during generation of the temporary tables).

Before MySQL 5.7.7, subqueries cannot be used in the `FROM` clause of a view.

There is a general principle that you cannot modify a table and select from the same table in a subquery. See [Section C.4, “Restrictions on Subqueries”](#).

The same principle also applies if you select from a view that selects from the table, if the view selects from the table in a subquery and the view is evaluated using the merge algorithm. Example:

```
CREATE VIEW v1 AS
SELECT * FROM t2 WHERE EXISTS (SELECT 1 FROM t1 WHERE t1.a = t2.a);

UPDATE t1, v2 SET t1.a = 1 WHERE t1.b = v2.b;
```

If the view is evaluated using a temporary table, you *can* select from the table in the view subquery and still modify that table in the outer query. In this case the view will be stored in a temporary table and thus you are not really selecting from the table in a subquery and modifying it “at the same time.” (This is another reason you might wish to force MySQL to use the temptable algorithm by specifying `ALGORITHM = TEMPTABLE` in the view definition.)

You can use `DROP TABLE` or `ALTER TABLE` to drop or alter a table that is used in a view definition. No warning results from the `DROP` or `ALTER` operation, even though this invalidates the view. Instead, an error occurs later, when the view is used. `CHECK TABLE` can be used to check for views that have been invalidated by `DROP` or `ALTER` operations.

With regard to view updatability, the overall goal for views is that if any view is theoretically updatable, it should be updatable in practice. MySQL as quickly as possible. Many theoretically updatable views can be updated now, but limitations still exist. For details, see [Section 23.5.3, “Updatable and Insertable Views”](#).

There exists a shortcoming with the current implementation of views. If a user is granted the basic privileges necessary to create a view (the `CREATE VIEW` and `SELECT` privileges), that user will be unable to call `SHOW CREATE VIEW` on that object unless the user is also granted the `SHOW VIEW` privilege.

That shortcoming can lead to problems backing up a database with `mysqldump`, which may fail due to insufficient privileges. This problem is described in Bug #22062.

The workaround to the problem is for the administrator to manually grant the `SHOW VIEW` privilege to users who are granted `CREATE VIEW`, since MySQL doesn't grant it implicitly when views are created.

Views do not have indexes, so index hints do not apply. Use of index hints when selecting from a view is not permitted.

`SHOW CREATE VIEW` displays view definitions using an `AS alias_name` clause for each column. If a column is created from an expression, the default alias is the expression text, which can be quite long. Aliases for column names in `CREATE VIEW` statements are checked against the maximum column length of 64 characters (not the maximum alias length of 256 characters). As a result, views created

from the output of `SHOW CREATE VIEW` fail if any column alias exceeds 64 characters. This can cause problems in the following circumstances for views with too-long aliases:

- View definitions fail to replicate to newer slaves that enforce the column-length restriction.
- Dump files created with `mysqldump` cannot be loaded into servers that enforce the column-length restriction.

A workaround for either problem is to modify each problematic view definition to use aliases that provide shorter column names. Then the view will replicate properly, and can be dumped and reloaded without causing an error. To modify the definition, drop and create the view again with `DROP VIEW` and `CREATE VIEW`, or replace the definition with `CREATE OR REPLACE VIEW`.

For problems that occur when reloading view definitions in dump files, another workaround is to edit the dump file to modify its `CREATE VIEW` statements. However, this does not change the original view definitions, which may cause problems for subsequent dump operations.

## C.6 Restrictions on XA Transactions

XA transaction support is limited to the `InnoDB` storage engine.

For “external XA,” a MySQL server acts as a Resource Manager and client programs act as Transaction Managers. For “Internal XA,” storage engines within a MySQL server act as RMs, and the server itself acts as a TM. Internal XA support is limited by the capabilities of individual storage engines. Internal XA is required for handling XA transactions that involve more than one storage engine. The implementation of internal XA requires that a storage engine support two-phase commit at the table handler level, and currently this is true only for `InnoDB`.

For `XA START`, the `JOIN` and `RESUME` clauses are not supported.

For `XA END`, the `SUSPEND [FOR MIGRATE]` clause is not supported.

The requirement that the `bqual` part of the `xid` value be different for each XA transaction within a global transaction is a limitation of the current MySQL XA implementation. It is not part of the XA specification.

Prior to MySQL 5.7.7, XA transactions were not compatible with replication. This was because an XA transaction that was in `PREPARED` state would be rolled back on clean server shutdown or client disconnect. Similarly, an XA transaction that was in `PREPARED` state would still exist in `PREPARED` state in case the server was shutdown abnormally and then started again, but the contents of the transaction could not be written to the binary log. In both of these situations the XA transaction could not be replicated correctly.

In MySQL 5.7.7 and later, there is a change in behavior and an XA transaction is written to the binary log in two parts. When `XA PREPARE` is issued, the first part of the transaction up to `XA PREPARE` is written using an initial GTID. A `XA_prepare_log_event` is used to identify such transactions in the binary log. When `XA COMMIT` or `XA ROLLBACK` is issued, a second part of the transaction containing only the `XA COMMIT` or `XA ROLLBACK` statement is written using a second GTID. Note that the initial part of the transaction, identified by `XA_prepare_log_event`, is not necessarily followed by its `XA COMMIT` or `XA ROLLBACK`, which can cause interleaved binary logging of any two XA transactions. The two parts of the XA transaction can even appear in different binary log files. This means that an XA transaction in `PREPARED` state is now persistent until an explicit `XA COMMIT` or `XA ROLLBACK` statement is issued, ensuring that XA transactions are compatible with replication.

On a replication slave, immediately after the XA transaction is prepared, it is detached from the slave applier thread, and can be committed or rolled back by any thread on the slave. This means that the same XA transaction can appear in the `events_transactions_current` table with different states on different threads. The `events_transactions_current` table displays the current status of the most recent monitored transaction event on the thread, and does not update this status when the thread is idle. So the XA transaction can still be displayed in the `PREPARED` state for the original applier

thread, after it has been processed by another thread. To positively identify XA transactions that are still in the `PREPARED` state and need to be recovered, use the `XA RECOVER` statement rather than the Performance Schema transaction tables.

The following restrictions exist for using XA transactions in MySQL 5.7.7 and later:

- XA transactions are not fully resilient to an unexpected halt with respect to the binary log. If there is an unexpected halt while the server is in the middle of executing an `XA PREPARE`, `XA COMMIT`, `XA ROLLBACK`, or `XA COMMIT ... ONE PHASE` statement, the server might not be able to recover to a correct state, leaving the server and the binary log in an inconsistent state. In this situation, the binary log might either contain extra XA transactions that are not applied, or miss XA transactions that are applied. Also, if GTIDs are enabled, after recovery `@@GLOBAL.GTID_EXECUTED` might not correctly describe the transactions that have been applied. Note that if an unexpected halt occurs before `XA PREPARE`, between `XA PREPARE` and `XA COMMIT` (or `XA ROLLBACK`), or after `XA COMMIT` (or `XA ROLLBACK`), the server and binary log are correctly recovered and taken to a consistent state.
- The use of replication filters or binary log filters in combination with XA transactions is not supported. Filtering of tables could cause an XA transaction to be empty on a replication slave, and empty XA transactions are not supported. Also, with the settings `master_info_repository=TABLE` and `relay_log_info_repository=TABLE` on a replication slave, which became the defaults in MySQL 8.0, the internal state of the data engine transaction is changed following a filtered XA transaction, and can become inconsistent with the replication transaction context state.

The error `ER_XA_REPLICATION_FILTERS` is logged whenever an XA transaction is impacted by a replication filter, whether or not the transaction was empty as a result. If the transaction is not empty, the replication slave is able to continue running, but you should take steps to discontinue the use of replication filters with XA transactions in order to avoid potential issues. If the transaction is empty, the replication slave stops. In that event, the replication slave might be in an undetermined state in which the consistency of the replication process might be compromised. In particular, the `gtid_executed` set on a slave of the slave might be inconsistent with that on the master. To resolve this situation, isolate the master and stop all replication, then check GTID consistency across the replication topology. Undo the XA transaction that generated the error message, then restart replication.

- Prior to MySQL 5.7.19, `FLUSH TABLES WITH READ LOCK` is not compatible with XA transactions.
- XA transactions are considered unsafe for statement-based replication. If two XA transactions committed in parallel on the master are being prepared on the slave in the inverse order, locking dependencies can occur that cannot be safely resolved, and it is possible for replication to fail with deadlock on the slave. This situation can occur for a single-threaded or multithreaded replication slave. When `binlog_format=STATEMENT` is set, a warning is issued for DML statements inside XA transactions. When `binlog_format=MIXED` or `binlog_format=ROW` is set, DML statements inside XA transactions are logged using row-based replication, and the potential issue is not present.

## C.7 Restrictions on Character Sets

- Identifiers are stored in `mysql` database tables (`user`, `db`, and so forth) using `utf8`, but identifiers can contain only characters in the Basic Multilingual Plane (BMP). Supplementary characters are not permitted in identifiers.
- The `ucs2`, `utf16`, `utf16le`, and `utf32` character sets have the following restrictions:
  - None of them can be used as the client character set. See [Impermissible Client Character Sets](#).
  - It is currently not possible to use `LOAD DATA INFILE` to load data files that use these character sets.
  - `FULLTEXT` indexes cannot be created on a column that uses any of these character sets. However, you can perform `IN BOOLEAN MODE` searches on the column without an index.

- The use of `ENCRYPT()` with these character sets is not recommended because the underlying system call expects a string terminated by a zero byte.
- The `REGEXP` and `RLIKE` operators work in byte-wise fashion, so they are not multibyte safe and may produce unexpected results with multibyte character sets. In addition, these operators compare characters by their byte values and accented characters may not compare as equal even if a given collation treats them as equal.

## C.8 Restrictions on Performance Schema

The Performance Schema avoids using mutexes to collect or produce data, so there are no guarantees of consistency and results can sometimes be incorrect. Event values in `performance_schema` tables are nondeterministic and nonrepeatable.

If you save event information in another table, you should not assume that the original events will still be available later. For example, if you select events from a `performance_schema` table into a temporary table, intending to join that table with the original table later, there might be no matches.

`mysqldump` and `BACKUP DATABASE` ignore tables in the `performance_schema` database.

Tables in the `performance_schema` database cannot be locked with `LOCK TABLES`, except the `setup_XXX` tables.

Tables in the `performance_schema` database cannot be indexed.

Results for queries that refer to tables in the `performance_schema` database are not saved in the query cache.

Tables in the `performance_schema` database are not replicated.

The Performance Schema is not available in `libmysqld`, the embedded server.

The types of timers might vary per platform. The `performance_timers` table shows which event timers are available. If the values in this table for a given timer name are `NULL`, that timer is not supported on your platform.

Instruments that apply to storage engines might not be implemented for all storage engines. Instrumentation of each third-party engine is the responsibility of the engine maintainer.

## C.9 Restrictions on Pluggable Authentication

The first part of this section describes general restrictions on the applicability of the pluggable authentication framework described at [Section 6.3.9, “Pluggable Authentication”](#). The second part describes how third-party connector developers can determine the extent to which a connector can take advantage of pluggable authentication capabilities and what steps to take to become more compliant.

The term “native authentication” used here refers to authentication against passwords stored in the `mysql.user` table. This is the same authentication method provided by older MySQL servers, before pluggable authentication was implemented. “Windows native authentication” refers to authentication using the credentials of a user who has already logged in to Windows, as implemented by the Windows Native Authentication plugin (“Windows plugin” for short).

### General Pluggable Authentication Restrictions

- **Connector/C, Connector/C++:** Clients that use these connectors can connect to the server only through accounts that use native authentication.

Exception: A connector supports pluggable authentication if it was built to link to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that

version is installed, or if the connector is recompiled from source to link against the current `libmysqlclient`.

- **Connector/NET:** Clients that use Connector/NET can connect to the server through accounts that use native authentication or Windows native authentication.
- **Connector/PHP:** Clients that use this connector can connect to the server only through accounts that use native authentication, when compiled using the MySQL native driver for PHP (`mysqlnd`).
- **Windows native authentication:** Connecting through an account that uses the Windows plugin requires Windows Domain setup. Without it, NTLM authentication is used and then only local connections are possible; that is, the client and server must run on the same computer.
- **Proxy users:** Proxy user support is available to the extent that clients can connect through accounts authenticated with plugins that implement proxy user capability (that is, plugins that can return a user name different from that of the connecting user). For example, the PAM and Windows plugins support proxy users. The `mysql_native_password` and `sha256_password` authentication plugins do not support proxy users by default, but can be configured to do so; see [Server Support for Proxy User Mapping](#).
- **Replication:** Replication slaves can employ not only master accounts using native authentication, but can also connect through master accounts that use nonnative authentication if the required client-side plugin is available. If the plugin is built into `libmysqlclient`, it is available by default. Otherwise, the plugin must be installed on the slave side in the directory named by the slave `plugin_dir` system variable.
- **FEDERATED tables:** A `FEDERATED` table can access the remote table only through accounts on the remote server that use native authentication.

## Pluggable Authentication and Third-Party Connectors

Third-party connector developers can use the following guidelines to determine readiness of a connector to take advantage of pluggable authentication capabilities and what steps to take to become more compliant:

- An existing connector to which no changes have been made uses native authentication and clients that use the connector can connect to the server only through accounts that use native authentication. *However, you should test the connector against a recent version of the server to verify that such connections still work without problem.*

Exception: A connector might work with pluggable authentication without any changes if it links to `libmysqlclient` dynamically (rather than statically) and it loads the current version of `libmysqlclient` if that version is installed.

- To take advantage of pluggable authentication capabilities, a connector that is `libmysqlclient`-based should be relinked against the current version of `libmysqlclient`. This enables the connector to support connections through accounts that require client-side plugins now built into `libmysqlclient` (such as the cleartext plugin needed for PAM authentication and the Windows plugin needed for Windows native authentication). Linking with a current `libmysqlclient` also enables the connector to access client-side plugins installed in the default MySQL plugin directory (typically the directory named by the default value of the local server's `plugin_dir` system variable).

If a connector links to `libmysqlclient` dynamically, it must be ensured that the newer version of `libmysqlclient` is installed on the client host and that the connector loads it at runtime.

- Another way for a connector to support a given authentication method is to implement it directly in the client/server protocol. Connector/NET uses this approach to provide support for Windows native authentication.
- If a connector should be able to load client-side plugins from a directory different from the default plugin directory, it must implement some means for client users to specify the directory. Possibilities

for this include a command-line option or environment variable from which the connector can obtain the directory name. Standard MySQL client programs such as `mysql` and `mysqladmin` implement a `--plugin-dir` option. See also [Section 27.8.14](#), “C API Client Plugin Functions”.

- Proxy user support by a connector depends, as described earlier in this section, on whether the authentication methods that it supports permit proxy users.

## C.10 Limits in MySQL

This section lists current limits in MySQL 5.7.

### C.10.1 Limits on Joins

The maximum number of tables that can be referenced in a single join is 61. This includes a join handled by merging derived tables and views in the `FROM` clause into the outer query block (see [Section 8.2.2.3](#), “Optimizing Derived Tables and View References”). It also applies to the number of tables that can be referenced in the definition of a view.

### C.10.2 Limits on Number of Databases and Tables

MySQL has no limit on the number of databases. The underlying file system may have a limit on the number of directories.

MySQL has no limit on the number of tables. The underlying file system may have a limit on the number of files that represent tables. Individual storage engines may impose engine-specific constraints. `InnoDB` permits up to 4 billion tables.

### C.10.3 Limits on Table Size

The effective maximum table size for MySQL databases is usually determined by operating system constraints on file sizes, not by MySQL internal limits. For up-to-date information operating system file size limits, refer to the documentation specific to your operating system.

Windows users, please note that FAT and VFAT (FAT32) are *not* considered suitable for production use with MySQL. Use NTFS instead.

If you encounter a full-table error, there are several reasons why it might have occurred:

- The disk might be full.
- You are using `InnoDB` tables and have run out of room in an `InnoDB` tablespace file. The maximum tablespace size is also the maximum size for a table. For tablespace size limits, see [Section 14.8.1.7](#), “Limits on InnoDB Tables”.

Generally, partitioning of tables into multiple tablespace files is recommended for tables larger than 1TB in size.

- You have hit an operating system file size limit. For example, you are using `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is permitted by the internal pointer size. `MyISAM` permits data and index files to grow up to 256TB by default, but this limit can be changed up to the maximum permissible size of 65,536TB ( $256^7 - 1$  bytes).

If you need a `MyISAM` table that is larger than the default limit and your operating system supports large files, the `CREATE TABLE` statement supports `AVG_ROW_LENGTH` and `MAX_ROWS` options. See [Section 13.1.18](#), “CREATE TABLE Syntax”. The server uses these options to determine how large a table to permit.

If the pointer size is too small for an existing table, you can change the options with `ALTER TABLE` to increase a table's maximum permissible size. See [Section 13.1.8, “ALTER TABLE Syntax”](#).

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

To change the default size limit for `MyISAM` tables, set the `myisam_data_pointer_size`, which sets the number of bytes used for internal row pointers. The value is used to set the pointer size for new tables if you do not specify the `MAX_ROWS` option. The value of `myisam_data_pointer_size` can be from 2 to 7. A value of 4 permits tables up to 4GB; a value of 6 permits tables up to 256TB.

You can check the maximum data and index sizes by using this statement:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`. See [Section 13.7.5, “SHOW Syntax”](#), or [Section 4.6.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

Other ways to work around file-size limits for `MyISAM` tables are as follows:

- If your large table is read only, you can use `myisampack` to compress it. `myisampack` usually compresses a table by at least 50%, so you can have, in effect, much bigger tables. `myisampack` also can merge multiple tables into a single table. See [Section 4.6.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).
- MySQL includes a `MERGE` library that enables you to handle a collection of `MyISAM` tables that have identical structure as a single `MERGE` table. See [Section 15.7, “The MERGE Storage Engine”](#).
- You are using the `MEMORY (HEAP)` storage engine; in this case you need to increase the value of the `max_heap_table_size` system variable. See [Section 5.1.7, “Server System Variables”](#).

## C.10.4 Limits on Table Column Count and Row Size

### Column Count Limits

MySQL has hard limit of 4096 columns per table, but the effective maximum may be less for a given table. The exact column limit depends on several factors:

- The maximum row size for a table constrains the number (and possibly size) of columns because the total length of all columns cannot exceed this size. See [Row Size Limits](#).
- The storage requirements of individual columns constrain the number of columns that fit within a given maximum row size. Storage requirements for some data types depend on factors such as storage engine, storage format, and character set. See [Section 11.8, “Data Type Storage Requirements”](#).
- Storage engines may impose additional restrictions that limit table column count. For example, `InnoDB` has a limit of 1017 columns per table. See [Section 14.8.1.7, “Limits on InnoDB Tables”](#). For information about other storage engines, see [Chapter 15, Alternative Storage Engines](#).
- Each table has an `.frm` file that contains the table definition. The definition affects the content of this file in ways that may affect the number of columns permitted in the table. See [Section C.10.5, “Limits Imposed by .frm File Structure”](#).

### Row Size Limits

The maximum row size for a given table is determined by several factors:

- The internal representation of a MySQL table has a maximum row size limit of 65,535 bytes, even if the storage engine is capable of supporting larger rows. [BLOB](#) and [TEXT](#) columns only contribute 9 to 12 bytes toward the row size limit because their contents are stored separately from the rest of the row.
- The maximum row size for an [InnoDB](#) table, which applies to data stored locally within a database page, is slightly less than half a page for 4KB, 8KB, 16KB, and 32KB [innodb\\_page\\_size](#) settings. For example, the maximum row size is slightly less than 8KB for the default 16KB [InnoDB](#) page size. For 64KB pages, the maximum row size is slightly less than 16KB. See [Section 14.8.1.7, “Limits on InnoDB Tables”](#).

If a row containing [variable-length columns](#) exceeds the [InnoDB](#) maximum row size, [InnoDB](#) selects variable-length columns for external off-page storage until the row fits within the [InnoDB](#) row size limit. The amount of data stored locally for variable-length columns that are stored off-page differs by row format. For more information, see [Section 14.11, “InnoDB Row Storage and Row Formats”](#).

- Different storage formats use different amounts of page header and trailer data, which affects the amount of storage available for rows.
- For information about [InnoDB](#) row formats, see [Section 14.11, “InnoDB Row Storage and Row Formats”](#), and [Section 14.8.1.2, “The Physical Row Structure of an InnoDB Table”](#).
- For information about [MyISAM](#) storage formats, see [Section 15.2.3, “MyISAM Table Storage Formats”](#).

## Row Size Limit Examples

- The MySQL maximum row size limit of 65,535 bytes is demonstrated in the following [InnoDB](#) and [MyISAM](#) examples. The limit is enforced regardless of storage engine, even though the storage engine may be capable of supporting larger rows.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g VARCHAR(6000)) ENGINE=InnoDB CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g VARCHAR(6000)) ENGINE=MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

In the following [MyISAM](#) example, changing a column to [TEXT](#) avoids the 65,535-byte row size limit and permits the operation to succeed because [BLOB](#) and [TEXT](#) columns only contribute 9 to 12 bytes toward the row size.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g TEXT(6000)) ENGINE=MyISAM CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The operation succeeds for an [InnoDB](#) table because changing a column to [TEXT](#) avoids the MySQL 65,535-byte row size limit, and [InnoDB](#) off-page storage of variable-length columns avoids the [InnoDB](#) row size limit.

```
mysql> CREATE TABLE t (a VARCHAR(10000), b VARCHAR(10000),
    c VARCHAR(10000), d VARCHAR(10000), e VARCHAR(10000),
    f VARCHAR(10000), g TEXT(6000)) ENGINE=InnoDB CHARACTER SET latin1;
```

```
Query OK, 0 rows affected (0.02 sec)
```

- Storage for variable-length columns includes length bytes, which are counted toward the row size. For example, a `VARCHAR(255) CHARACTER SET utf8mb3` column takes two bytes to store the length of the value, so each value can take up to 767 bytes.

The statement to create table `t1` succeeds because the columns require 32,765 + 2 bytes and 32,766 + 2 bytes, which falls within the maximum row size of 65,535 bytes:

```
mysql> CREATE TABLE t1
      (c1 VARCHAR(32765) NOT NULL, c2 VARCHAR(32766) NOT NULL)
      ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.02 sec)
```

The statement to create table `t2` fails because, although the column length is within the maximum length of 65,535 bytes, two additional bytes are required to record the length, which causes the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t2
      (c1 VARCHAR(65535) NOT NULL)
      ENGINE = InnoDB CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

Reducing the column length to 65,533 or less permits the statement to succeed.

```
mysql> CREATE TABLE t2
      (c1 VARCHAR(65533) NOT NULL)
      ENGINE = InnoDB CHARACTER SET latin1;
Query OK, 0 rows affected (0.01 sec)
```

- For `MyISAM` tables, `NULL` columns require additional space in the row to record whether their values are `NULL`. Each `NULL` column takes one bit extra, rounded up to the nearest byte.

The statement to create table `t3` fails because `MyISAM` requires space for `NULL` columns in addition to the space required for variable-length column length bytes, causing the row size to exceed 65,535 bytes:

```
mysql> CREATE TABLE t3
      (c1 VARCHAR(32765) NULL, c2 VARCHAR(32766) NULL)
      ENGINE = MyISAM CHARACTER SET latin1;
ERROR 1118 (42000): Row size too large. The maximum row size for the used
table type, not counting BLOBs, is 65535. This includes storage overhead,
check the manual. You have to change some columns to TEXT or BLOBs
```

For information about `InnoDB` `NULL` column storage, see [Section 14.8.1.2, “The Physical Row Structure of an InnoDB Table”](#).

- `InnoDB` restricts row size (for data stored locally within the database page) to slightly less than half a database page for 4KB, 8KB, 16KB, and 32KB `innodb_page_size` settings, and to slightly less than 16KB for 64KB pages.

The statement to create table `t4` fails because the defined columns exceed the row size limit for a 16KB `InnoDB` page.

```
mysql> CREATE TABLE t4 (
      c1 CHAR(255), c2 CHAR(255), c3 CHAR(255),
      c4 CHAR(255), c5 CHAR(255), c6 CHAR(255),
      c7 CHAR(255), c8 CHAR(255), c9 CHAR(255),
      c10 CHAR(255), c11 CHAR(255), c12 CHAR(255),
      c13 CHAR(255), c14 CHAR(255), c15 CHAR(255),
```

```
c16 CHAR(255),c17 CHAR(255),c18 CHAR(255),
c19 CHAR(255),c20 CHAR(255),c21 CHAR(255),
c22 CHAR(255),c23 CHAR(255),c24 CHAR(255),
c25 CHAR(255),c26 CHAR(255),c27 CHAR(255),
c28 CHAR(255),c29 CHAR(255),c30 CHAR(255),
c31 CHAR(255),c32 CHAR(255),c33 CHAR(255)
) ENGINE=InnoDB ROW_FORMAT=COMPACT DEFAULT CHARSET latin1;
ERROR 1118 (42000): Row size too large (> 8126). Changing some columns to TEXT or BLOB or using
ROW_FORMAT=DYNAMIC or ROW_FORMAT=COMPRESSED may help. In current row format, BLOB prefix of 768
bytes is stored inline.
```

## C.10.5 Limits Imposed by .frm File Structure

Each table has an `.frm` file that contains the table definition. The server uses the following expression to check some of the table information stored in the file against an upper limit of 64KB:

```
if (info_length+(ulong) create_fields.elements*FCOMP+288+
    n_length+int_length+com_length > 65535L || int_count > 255)
```

The portion of the information stored in the `.frm` file that is checked against the expression cannot grow beyond the 64KB limit, so if the table definition reaches this size, no more columns can be added.

The relevant factors in the expression are:

- `info_length` is space needed for “screens.” This is related to MySQL’s Unireg heritage.
- `create_fields.elements` is the number of columns.
- `FCOMP` is 17.
- `n_length` is the total length of all column names, including one byte per name as a separator.
- `int_length` is related to the list of values for `ENUM` and `SET` columns. In this context, “int” does not mean “integer.” It means “interval,” a term that refers collectively to `ENUM` and `SET` columns.
- `int_count` is the number of unique `ENUM` and `SET` definitions.
- `com_length` is the total length of column comments.

The expression just described has several implications for permitted table definitions:

- Using long column names can reduce the maximum number of columns, as can the inclusion of `ENUM` or `SET` columns, or use of column comments.
- A table can have no more than 255 unique `ENUM` and `SET` definitions. Columns with identical element lists are considered the same against this limit. For example, if a table contains these two columns, they count as one (not two) toward this limit because the definitions are identical:

```
e1 ENUM('a','b','c')
e2 ENUM('a','b','c')
```

- The sum of the length of element names in the unique `ENUM` and `SET` definitions counts toward the 64KB limit, so although the theoretical limit on number of elements in a given `ENUM` column is 65,535, the practical limit is less than 3000.

## C.10.6 Windows Platform Limitations

The following limitations apply to use of MySQL on the Windows platform:

- **Process memory**

On Windows 32-bit platforms, it is not possible by default to use more than 2GB of RAM within a single process, including MySQL. This is because the physical address limit on Windows 32-bit

is 4GB and the default setting within Windows is to split the virtual address space between kernel (2GB) and user/applications (2GB).

Some versions of Windows have a boot time setting to enable larger applications by reducing the kernel application. Alternatively, to use more than 2GB, use a 64-bit version of Windows.

- **File system aliases**

When using `MyISAM` tables, you cannot use aliases within Windows link to the data files on another volume and then link back to the main MySQL `datadir` location.

This facility is often used to move the data and index files to a RAID or other fast solution, while retaining the main `.frm` files in the default data directory configured with the `datadir` option.

- **Limited number of ports**

Windows systems have about 4,000 ports available for client connections, and after a connection on a port closes, it takes two to four minutes before the port can be reused. In situations where clients connect to and disconnect from the server at a high rate, it is possible for all available ports to be used up before closed ports become available again. If this happens, the MySQL server appears to be unresponsive even though it is running. Ports may be used by other applications running on the machine as well, in which case the number of ports available to MySQL is lower.

For more information about this problem, see <http://support.microsoft.com/default.aspx?scid=kb;en-us;196271>.

- **DATA DIRECTORY and INDEX DIRECTORY**

The `DATA DIRECTORY` option for `CREATE TABLE` is supported on Windows only for `InnoDB` tables, as described in [Section 14.7.5, “Creating a Tablespace Outside of the Data Directory”](#). For `MyISAM` and other storage engines, the `DATA DIRECTORY` and `INDEX DIRECTORY` options for `CREATE TABLE` are ignored on Windows and any other platforms with a nonfunctional `realpath()` call.

- **DROP DATABASE**

You cannot drop a database that is in use by another session.

- **Case-insensitive names**

File names are not case-sensitive on Windows, so MySQL database and table names are also not case-sensitive on Windows. The only restriction is that database and table names must be specified using the same case throughout a given statement. See [Section 9.2.2, “Identifier Case Sensitivity”](#).

- **Directory and file names**

On Windows, MySQL Server supports only directory and file names that are compatible with the current ANSI code pages. For example, the following Japanese directory name will not work in the Western locale (code page 1252):

```
datadir="C:/私たちのプロジェクトのデータ"
```

The same limitation applies to directory and file names referred to in SQL statements, such as the data file path name in `LOAD DATA INFILE`.

- **The \ path name separator character**

Path name components in Windows are separated by the `\` character, which is also the escape character in MySQL. If you are using `LOAD DATA INFILE` or `SELECT ... INTO OUTFILE`, use Unix-style file names with `/` characters:

```
mysql> LOAD DATA INFILE 'C:/tmp/skr.txt' INTO TABLE skr;
```

```
mysql> SELECT * INTO OUTFILE 'C:/tmp/skr.txt' FROM skr;
```

Alternatively, you must double the `\` character:

```
mysql> LOAD DATA INFILE 'C:\\tmp\\skr.txt' INTO TABLE skr;  
mysql> SELECT * INTO OUTFILE 'C:\\tmp\\skr.txt' FROM skr;
```

- **Problems with pipes**

Pipes do not work reliably from the Windows command-line prompt. If the pipe includes the character `^Z / CHAR(24)`, Windows thinks that it has encountered end-of-file and aborts the program.

This is mainly a problem when you try to apply a binary log as follows:

```
C:\> mysqlbinlog binary_log_file | mysql --user=root
```

If you have a problem applying the log and suspect that it is because of a `^Z / CHAR(24)` character, you can use the following workaround:

```
C:\> mysqlbinlog binary_log_file --result-file=/tmp/bin.sql  
C:\> mysql --user=root --execute "source /tmp/bin.sql"
```

The latter command also can be used to reliably read in any SQL file that may contain binary data.

---

Chapter 3, *Tutorial*

Section 1.2, “Typographical and Syntax Conventions”

Unicode Support on Windows

Section 2.11.1, “Upgrading MySQL”

Section 2.11.1.9, “Upgrading MySQL with Directly-Downloaded RPM Packages”

Section 7.3.2, “Using Backups for Recovery”

Section 16.1.3.5, “Using GTIDs for Failover and Scaleout”

Section 6.5.6.3, “Using MySQL Enterprise Firewall”

Section 3.5, “Using `mysql` in Batch Mode”

Section 4.6.7.3, “Using `mysqlbinlog` to Back Up Binary Log Files”

Section 7.4, “Using `mysqldump` for Backups”

Section 4.2.6, “Using Option Files”

Section 4.2.4, “Using Options on the Command Line”

Section 4.2.8, “Using Options to Set Program Variables”

Using Safe-Updates Mode (`--safe-updates`)

Section 28.5.1.6, “Using Server Logs to Find Causes of Errors in `mysqld`”

Section 21.5.13.2, “Using Symbolic Links with Disk Data Objects”

Using the Test Protocol Trace Plugin

Using Your Own Protocol Trace Plugins

Section 1.4, “What Is New in MySQL 5.7”

Section 21.1.4.1, “What is New in NDB Cluster 7.5”

Section 21.1.4.2, “What is New in NDB Cluster 7.6”

Section 2.3.7, “Windows Postinstallation Procedures”

Section 12.11, “XML Functions”

## **`mysql < dump_file`**

Section 2.11.1.3, “Changes in MySQL 5.7”

## **`mysql ...`**

Section 28.5.1.1, “Compiling MySQL for Debugging”

## **`mysql-server`**

Section 2.8, “Installing MySQL on FreeBSD”

## **`mysql-test-run.pl`**

Section 4.6.6, “`mysql_config_editor` — MySQL Configuration Utility”

Section 28.1.2, “The MySQL Test Suite”

Section 4.2.6, “Using Option Files”

## **`mysql-test-run.pl test_name`**

Section 28.1.2, “The MySQL Test Suite”

## **`mysql.exe`**

Section 21.2.4.3, “Initial Startup of NDB Cluster on Windows”

Section 21.2.4.1, “Installing NDB Cluster on Windows from a Binary Release”

Unicode Support on Windows

## **`mysql.server`**

Section 2.5, “Installing MySQL on Linux”

Section 21.2.3.2, “Installing NDB Cluster from RPM”

Section 6.1.3, “Making MySQL Secure Against Attackers”

Section 4.3.3, “`mysql.server` — MySQL Server Startup Script”

Section 4.6.8, “`mysqldumpslow` — Summarize Slow Query Log Files”

Section 4.1, “Overview of MySQL Programs”

Section 5.1.6, “Server Command Options”

Section 2.10.5, “Starting and Stopping MySQL Automatically”

---
